## **MG32F02A032** ***Register Definition*** ***Guide***

**Version 1.53**  
**Date 2023/10/25**

## List of Contents

|  |           |
|--|-----------|
| <b>1. Registers</b> .....                          | <b>12</b> |
| 1.1. IO Port Control Registers .....               | 12        |
| 1.1.1. PA output data register .....               | 12        |
| 1.1.2. PA input data register.....                 | 12        |
| 1.1.3. PA port set / clear register.....           | 13        |
| 1.1.4. PA port set and clear register 0.....       | 14        |
| 1.1.5. PA port set and clear register 2.....       | 14        |
| 1.1.6. PA port set and clear register 3.....       | 15        |
| 1.1.7. PB output data register .....               | 15        |
| 1.1.8. PB input data register.....                 | 16        |
| 1.1.9. PB port set / clear register.....           | 16        |
| 1.1.10. PB port set and clear register 0.....      | 17        |
| 1.1.11. PB port set and clear register 2.....      | 18        |
| 1.1.12. PB port set and clear register 3.....      | 18        |
| 1.1.13. PC output data register .....              | 19        |
| 1.1.14. PC input data register .....               | 19        |
| 1.1.15. PC port set / clear register .....         | 20        |
| 1.1.16. PC port set and clear register 0 .....     | 21        |
| 1.1.17. PC port set and clear register 1 .....     | 21        |
| 1.1.18. PC port set and clear register 2 .....     | 22        |
| 1.1.19. PC port set and clear register 3 .....     | 22        |
| 1.1.20. PD output data register .....              | 23        |
| 1.1.21. PD input data register .....               | 23        |
| 1.1.22. PD port set / clear register .....         | 24        |
| 1.1.23. PD port set and clear register 0 .....     | 25        |
| 1.1.24. PD port set and clear register 1 .....     | 25        |
| 1.1.25. PD port set and clear register 2 .....     | 26        |
| 1.1.26. IOP Register Map .....                     | 27        |
| 1.2. Port A Configure Registers .....              | 30        |
| 1.2.1. PA0 IO control register.....                | 30        |
| 1.2.2. PA1 IO control register.....                | 31        |
| 1.2.3. PA2 IO control register.....                | 31        |
| 1.2.4. PA3 IO control register.....                | 32        |
| 1.2.5. PA8 IO control register.....                | 33        |
| 1.2.6. PA9 IO control register.....                | 34        |
| 1.2.7. PA10 IO control register.....               | 35        |
| 1.2.8. PA11 IO control register.....               | 36        |
| 1.2.9. PA12 IO control register.....               | 37        |
| 1.2.10. PA13 IO control register.....              | 38        |
| 1.2.11. PA14 IO control register.....              | 39        |
| 1.2.12. PA15 IO control register.....              | 40        |
| 1.2.13. PA port input filter control register..... | 41        |
| 1.2.14. PA Register Map.....                       | 42        |
| 1.3. Port B Configure Registers.....               | 44        |

|         |  |    |
|---------|--|----|
| 1.3.1.  | PB0 IO control register.....               | 44 |
| 1.3.2.  | PB1 IO control register.....               | 45 |
| 1.3.3.  | PB2 IO control register.....               | 45 |
| 1.3.4.  | PB3 IO control register.....               | 46 |
| 1.3.5.  | PB8 IO control register.....               | 47 |
| 1.3.6.  | PB9 IO control register.....               | 48 |
| 1.3.7.  | PB10 IO control register.....              | 49 |
| 1.3.8.  | PB11 IO control register.....              | 50 |
| 1.3.9.  | PB13 IO control register.....              | 51 |
| 1.3.10. | PB14 IO control register.....              | 52 |
| 1.3.11. | PB port input filter control register..... | 53 |
| 1.3.12. | PB Register Map.....                       | 54 |
| 1.4.    | Port C Configure Registers.....            | 56 |
| 1.4.1.  | PC0 IO control register.....               | 56 |
| 1.4.2.  | PC1 IO control register.....               | 57 |
| 1.4.3.  | PC2 IO control register.....               | 57 |
| 1.4.4.  | PC3 IO control register.....               | 58 |
| 1.4.5.  | PC4 IO control register.....               | 59 |
| 1.4.6.  | PC5 IO control register.....               | 60 |
| 1.4.7.  | PC6 IO control register.....               | 61 |
| 1.4.8.  | PC8 IO control register.....               | 62 |
| 1.4.9.  | PC9 IO control register.....               | 63 |
| 1.4.10. | PC10 IO control register.....              | 64 |
| 1.4.11. | PC11 IO control register.....              | 65 |
| 1.4.12. | PC12 IO control register.....              | 66 |
| 1.4.13. | PC13 IO control register.....              | 67 |
| 1.4.14. | PC14 IO control register.....              | 68 |
| 1.4.15. | PC port input filter control register..... | 69 |
| 1.4.16. | PC Register Map.....                       | 70 |
| 1.5.    | Port D Configure Registers.....            | 72 |
| 1.5.1.  | PD0 IO control register.....               | 72 |
| 1.5.2.  | PD1 IO control register.....               | 73 |
| 1.5.3.  | PD2 IO control register.....               | 73 |
| 1.5.4.  | PD3 IO control register.....               | 74 |
| 1.5.5.  | PD7 IO control register.....               | 75 |
| 1.5.6.  | PD8 IO control register.....               | 76 |
| 1.5.7.  | PD9 IO control register.....               | 77 |
| 1.5.8.  | PD10 IO control register.....              | 78 |
| 1.5.9.  | PD port input filter control register..... | 79 |
| 1.5.10. | PD Register Map.....                       | 80 |
| 1.6.    | GPL Control Registers.....                 | 82 |
| 1.6.1.  | GPL status register.....                   | 82 |
| 1.6.2.  | GPL control register 0.....                | 82 |
| 1.6.3.  | GPL control register 1.....                | 83 |
| 1.6.4.  | GPL data input register.....               | 83 |
| 1.6.5.  | GPL data output register.....              | 84 |

|         |  |     |
|---------|--|-----|
| 1.6.6.  | GPL CRC initial register .....                           | 84  |
| 1.6.7.  | GPL Register Map .....                                   | 85  |
| 1.7.    | DMA Control Registers .....                              | 86  |
| 1.7.1.  | DMA status register .....                                | 86  |
| 1.7.2.  | DMA interrupt enable register .....                      | 86  |
| 1.7.3.  | DMA global control register 0 .....                      | 87  |
| 1.7.4.  | DMA channel-0 control register 0 .....                   | 88  |
| 1.7.5.  | DMA channel-0 control register 1 .....                   | 89  |
| 1.7.6.  | DMA channel-0 control register 1 .....                   | 90  |
| 1.7.7.  | DMA channel-0 control register 1 .....                   | 90  |
| 1.7.8.  | DMA channel-0 source start address register .....        | 91  |
| 1.7.9.  | DMA channel-0 source current address register .....      | 91  |
| 1.7.10. | DMA channel-0 destination start address register .....   | 91  |
| 1.7.11. | DMA channel-0 destination current address register ..... | 92  |
| 1.7.12. | DMA Register Map .....                                   | 93  |
| 1.8.    | Reset Control Registers .....                            | 95  |
| 1.8.1.  | RST Reset status register .....                          | 95  |
| 1.8.2.  | RST write protected Key register .....                   | 96  |
| 1.8.3.  | RST control register 0 .....                             | 97  |
| 1.8.4.  | RST Cold reset enable register .....                     | 98  |
| 1.8.5.  | RST Warm reset enable register .....                     | 99  |
| 1.8.6.  | RST AHB reset register .....                             | 100 |
| 1.8.7.  | RST APB reset register 0 .....                           | 101 |
| 1.8.8.  | RST APB reset register 1 .....                           | 102 |
| 1.8.9.  | RST Register Map .....                                   | 103 |
| 1.9.    | Clock Control Registers .....                            | 104 |
| 1.9.1.  | CSC status register .....                                | 104 |
| 1.9.2.  | CSC interrupt enable register .....                      | 105 |
| 1.9.3.  | CSC OSC and PLL control register .....                   | 106 |
| 1.9.4.  | CSC write protected Key register .....                   | 106 |
| 1.9.5.  | CSC clock source control register 0 .....                | 106 |
| 1.9.6.  | CSC clock divider register .....                         | 107 |
| 1.9.7.  | CSC internal clock output control register .....         | 108 |
| 1.9.8.  | CSC AHB clock control register .....                     | 109 |
| 1.9.9.  | CSC APB clock control register 0 .....                   | 110 |
| 1.9.10. | CSC APB clock control register 1 .....                   | 111 |
| 1.9.11. | CSC SLEEP mode clock enable register 0 .....             | 111 |
| 1.9.12. | CSC SLEEP mode clock enable register 1 .....             | 112 |
| 1.9.13. | CSC STOP mode clock enable register 0 .....              | 113 |
| 1.9.14. | CSC clock source select register 0 .....                 | 114 |
| 1.9.15. | CSC clock source select register 1 .....                 | 114 |
| 1.9.16. | CSC clock source select register 2 .....                 | 115 |
| 1.9.17. | CSC Register Map .....                                   | 116 |
| 1.10.   | Power Control Registers .....                            | 118 |
| 1.10.1. | PW status register .....                                 | 118 |
| 1.10.2. | PW interrupt enable register .....                       | 119 |

|   |     |
|---|-----|
| 1.10.3. PW write protected Key register.....                | 119 |
| 1.10.4. PW control register 0.....                          | 119 |
| 1.10.5. PW control register 1.....                          | 121 |
| 1.10.6. PW STOP mode wakeup control register 0.....         | 121 |
| 1.10.7. PW STOP mode wakeup control register 1.....         | 122 |
| 1.10.8. PW Register Map.....                                | 124 |
| 1.11. System Control Registers.....                         | 125 |
| 1.11.1. SYS interrupt enable register.....                  | 125 |
| 1.11.2. SYS chip manufacture identification code.....       | 125 |
| 1.11.3. SYS System control register 0.....                  | 125 |
| 1.11.4. SYS Backup register 0.....                          | 126 |
| 1.11.5. SYS Register Map.....                               | 127 |
| 1.12. Memory Control Registers.....                         | 128 |
| 1.12.1. MEM status register.....                            | 128 |
| 1.12.2. MEM interrupt enable register.....                  | 128 |
| 1.12.3. MEM write protected key register.....               | 129 |
| 1.12.4. MEM control register 0.....                         | 130 |
| 1.12.5. MEM control register 1.....                         | 131 |
| 1.12.6. MEM Flash memory protected key register.....        | 132 |
| 1.12.7. MEM Flash memory IAP size register.....             | 132 |
| 1.12.8. MEM Register Map.....                               | 134 |
| 1.13. Hardware Configure Registers.....                     | 135 |
| 1.13.1. CFG write protected Key register.....               | 135 |
| 1.13.2. CFG option byte register 00.....                    | 135 |
| 1.13.3. CFG option byte register 01.....                    | 136 |
| 1.13.4. CFG option byte register 02.....                    | 136 |
| 1.13.5. CFG option byte register 03.....                    | 137 |
| 1.13.6. CFG option byte register 05.....                    | 138 |
| 1.13.7. CFG Register Map.....                               | 140 |
| 1.14. EXIC Interrupt Registers.....                         | 141 |
| 1.14.1. EXIC interrupt status register.....                 | 141 |
| 1.14.2. EXIC interrupt enable register.....                 | 141 |
| 1.14.3. EXIC control register 0.....                        | 142 |
| 1.14.4. EXIC PA input interrupt pending flag register.....  | 143 |
| 1.14.5. EXIC PA Pad input trigger select register.....      | 144 |
| 1.14.6. EXIC PA AOI Mask register.....                      | 146 |
| 1.14.7. EXIC PB input interrupt pending flag register.....  | 147 |
| 1.14.8. EXIC PB Pad input trigger select register.....      | 148 |
| 1.14.9. EXIC PB AOI Mask register.....                      | 149 |
| 1.14.10. EXIC PC input interrupt pending flag register..... | 151 |
| 1.14.11. EXIC PC Pad input trigger select register.....     | 152 |
| 1.14.12. EXIC PC AOI Mask register.....                     | 153 |
| 1.14.13. EXIC PD input interrupt pending flag register..... | 155 |
| 1.14.14. EXIC PD Pad input trigger select register.....     | 156 |
| 1.14.15. EXIC PD AOI Mask register.....                     | 157 |
| 1.14.16. EXIC Interrupt source identity register 0.....     | 158 |

|          |  |     |
|----------|--|-----|
| 1.14.17. | EXIC interrupt source identity register 1.....     | 159 |
| 1.14.18. | EXIC interrupt source identity register 2.....     | 159 |
| 1.14.19. | EXIC interrupt source identity register 3.....     | 160 |
| 1.14.20. | EXIC interrupt source identity register 4.....     | 161 |
| 1.14.21. | EXIC interrupt source identity register 5.....     | 161 |
| 1.14.22. | EXIC interrupt source identity register 6.....     | 162 |
| 1.14.23. | EXIC interrupt source identity register 7.....     | 162 |
| 1.14.24. | EXIC Register Map .....                            | 164 |
| 1.15.    | I2C0 Control Registers .....                       | 167 |
| 1.15.1.  | I2C0 status register .....                         | 167 |
| 1.15.2.  | I2C0 interrupt enable register.....                | 169 |
| 1.15.3.  | I2C0 clock source register.....                    | 170 |
| 1.15.4.  | I2C0 slave mode slave address code register .....  | 170 |
| 1.15.5.  | I2C0 control register 0.....                       | 171 |
| 1.15.6.  | I2C0 control register 1.....                       | 172 |

| Bit    | Attr | Bit Name     | Description   | Reset |
|--------|------|--------------|---|-------|
| 31..25 | -    | Reserved     | Reserved  | 0x00  |
| 24     | -    | Reserved     | Reserved  | 0x00  |
| 23     | rw   | I2C0_BERRF   | I2C bus error flag for invalid Stop/Start state. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00  |
| 22     | rw   | I2C0_ALOSF   | I2C bus arbitration lost error flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00  |
| 21     | rw   | I2C0_NACKF   | I2C Not Acknowledge received error flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00  |
| 20     | rw   | I2C0_TOVRF   | I2C data buffer transmit underrun error flag. Under the conditions, slave mode enables data buffer mode and clock stretching is disabled. When the data buffer is underrun, this bit is set and interrupt is generated if I2C0_ERR_IE is enabled. Also, the I2C0_ERRF is set. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00  |
| 19     | rw   | I2C0_ROVRF   | I2C data buffer receive overrun error flag. Under the conditions, slave mode enables data buffer mode and clock stretching is disabled. When the data buffer is overrun, this bit is set and interrupt is generated if I2C0_ERR_IE is enabled. Also, the I2C0_ERRF is set. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00  |
| 18     | rw   | I2C0_TXRF    | I2C transmit data register remained status. (set and clear by hardware) When occurs bus NACK error and I2C0_NACKF is asserted, this bit is used to check the data register content whether has remain data. The I2C master will STOP and firmware can calculate the corrected total transfer count by I2C0_ACNT. It is cleared in slave address matched state and updated after last byte NACK state.<br>0 = No data<br>1 = Remained data | 0x00  |
| 17     | rw   | I2C0_STPSTRF | I2C Stop or Start detection flag. (set by hardware and clear by software writing 1)   | 0x00  |

|    |    |            |   |      |
|----|----|------------|---|------|
|    |    |            | 0 = Normal (No event occurred)<br>1 = Happened (Event happened)   |      |
| 16 | rw | I2C0_TSCF  | I2C shadow buffer transfer complete flag. (set by hardware and clear by hardware or software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 15 | r  | I2C0_RWF   | I2C read or write transfer direction status. It always update at slave address read/write state.<br>0 = Write<br>1 = Read   | 0x00 |
| 14 | r  | I2C0_MSTF  | I2C master mode detection status. It set by Start command and clear by Stop state.  | 0x00 |
| 13 | r  | I2C0_SLAF  | I2C slave mode detection status.<br>It set by Slave address matched condition and clear by Start/Stop conditions.   | 0x00 |
| 12 | rw | I2C0_SADRF | I2C slave mode slave address matched flag. This flag is also asserted for master mode if transmit mode slave address unmatched or received mode slave address asserted. When wakeup from STOP mode by detection matched slave address, user needs to clear this bit to disable the clock stretching and releases clock signal for external master. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00 |
| 11 | rw | I2C0_ERRCF | I2C master mode NACK error flag and state control bit. (set by hardware and clear by software writing 1 or hardware auto clear during START/STOP state) This bit is asserted if occurs NACK during slave-address cycle or data cycle of receive access.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 10 | rw | I2C0_CNTF  | I2C buffer count I2C0_BUF_CNT empty status. (set by hardware and clear by software writing 1 or I2C0_BUF_CNT written)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 9  | rw | I2C0_STOPF | I2C stop detection flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 8  | rw | I2C0_RSTRF | I2C repeat start asserted flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 7  | rw | I2C0_TXF   | I2C Transmit data register empty. (set by hardware and clear by hardware or software writing 1) This bit is cleared when I2C_DAT is written or this flag set to 1 by software. The flag is set after I2C reset or Idle state.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x01 |
| 6  | rw | I2C0_RXF   | I2C Receive data register not empty. (set by hardware and clear by hardware or software writing 1) This bit is cleared when I2C0_DAT is read or this flag set to 1 by software. But it does not be cleared when I2C0_DAT is read by SWD debugging.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 5  | rw | I2C0_WUPF  | I2C wakeup from STOP mode flag. When hardware detect that the slave address is matched to I2C0_SADR (I2C0_SADR_EN=1) during STOP mode, this flag is asserted.(set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |

|   |    |                    |  |      |
|---|----|--------------------|--|------|
| 4 | rw | <b>I2C0_TMOUTF</b> | I2C time-out detect flag. (set and clear by hardware)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 3 | rw | <b>I2C0_ERRF</b>   | I2C error interrupt flag for invalid no ack, bus arbitration lost bus error or data overrun error. (set by hardware , clear by software setting 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)              | 0x00 |
| 2 | rw | <b>I2C0_BUFF</b>   | I2C buffer mode event flag. (set by hardware , clear by software setting 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 1 | rw | <b>I2C0_EVENTF</b> | I2C status event interrupt Flag. For Byte mode, this bit must be cleared and hardware can process to next state (set by hardware , clear by software setting 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00 |
| 0 | r  | <b>I2C0_BUSYF</b>  | I2C busy flag. (set and clear by hardware)<br>0 = Normal (No event occurred)<br>1 = Busy (Event happened)  | 0x00 |

### 1.15.2. I2C0 interrupt enable register

| 6      | rw   | I2C0_AA_LCK  | I2C0_AA and I2C0_PAA bits write access protected control. When selects locked, disables the register bit write access. I2C0_AA and I2C0_PAA are written effectively only by written 1 to this bit simultaneously.<br>0 = Locked<br>1 = un-Locked   | 0x00  |
| 5      | rw   | I2C0_STO_LCK | I2C0_STO and I2C0_PSTO bits write access protected control. When selects locked, disables the register bit write access. I2C0_STO and I2C0_PSTO are written effectively only by written 1 to this bit simultaneously.<br>0 = Locked<br>1 = un-Locked   | 0x00  |
| 4      | rw   | I2C0_STA_LCK | I2C0_STA and I2C0_PSTA bits write access protected control. When selects locked, disables the register bit write access. I2C0_STA and I2C0_PSTA are written effectively only by written 1 to this bit simultaneously.<br>0 = Locked<br>1 = un-Locked   | 0x00  |

|   |    |                    |  |      |
|---|----|--------------------|--|------|
| 3 | rw | <b>I2C0_CMD_TC</b> | I2C command preload enable control bit. When enables, it will write hold until I2C0_TCF set for I2C0_STA, I2C0_STO, I2C0_AA register bits. When disables, write these command bits that will directly execute the setting command. This bit is no effect if I2C0_BUF_EN=0.<br>0 = Disable<br>1 = Enable  | 0x00 |
| 2 | rw | <b>I2C0_AA</b>     | I2C assert Acknowledge enable bit.<br>If the AA bit is set to '1', an ACK will be returned during the ACK clock pulse on the SCL line when:<br>1) The own slave address has been received.<br>2) A data byte has been received while I2C is in the master/receiver mode.<br>3) A data byte has been received while I2C is in the addressed slave/receiver mode.<br>If the AA flag is reset to '0', a NACK will be returned during the ACK clock pulse on SCL when:<br>1) A data has been received while I2C is in the master/receiver mode.<br>2) A data byte has been received while I2C is in the addressed slave/receiver mode.   | 0x00 |
| 1 | rw | <b>I2C0_STO</b>    | I2C STOP enable bit.<br>When the STO bit is set while I2C is in a master mode, a STOP condition is transmitted to the serial bus. When the STOP condition is detected on the bus, the I2C hardware clears the STO flag. In a slave mode, the STO flag may be set to recover from a bus error condition. In this case, no STOP condition is transmitted to the bus. However, the I2C hardware behaves as if a STOP condition has been received and switches to the defined not addressed slave receiver mode. The STO flag is automatically cleared by hardware. If the STA and STO bits are both set, then a STOP condition is transmitted to the bus if I2C is in a master mode (in a slave mode, I2C generates an internal STOP condition which is not transmitted), and then transmits a START condition. | 0x00 |
| 0 | rw | <b>I2C0_STA</b>    | I2C START enable bit.<br>When the STA bit is set to enter a master mode, the I2C hardware checks the status of the serial bus and generates a START condition if the bus is free. If the bus is not free, then I2C waits for a STOP condition and generates a START condition after a delay. If STA is set while I2C is already in a master mode and one or more bytes are transmitted or received, I2C transmits a repeated START condition. STA may be set at any time. STA may also be set when I2C is an addressed slave. When the STA bit is reset, no START condition or repeated START condition will be generated.   | 0x00 |

| 16 | rw | <b>URT0_BKF</b>    | UART break condition detect flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 15 | r  | <b>URT0_CALOVF</b> | UART auto baud-rate calibration overflow status flag. This flag is asserted when the baud-rate calibration counter is changed overflow during baud-rate calibration (set and clear by hardware)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 14 | r  | <b>URT0_CALUDF</b> | UART auto baud-rate calibration underflow status flag. This flag is asserted when the baud-rate calibration counter is changed to zero during baud-rate calibration (set and clear by hardware)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00 |
| 13 | rw | <b>URT0_CALCFC</b> | UART auto baud-rate calibration complete flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 12 | rw | <b>URT0_TMOF</b>   | UART timeout timer timeout flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 11 | rw | <b>URT0_BRTF</b>   | UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 10 | rw | <b>URT0_SADRF</b>  | UART slave address matched flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 9  | -  | <b>Reserved</b>    | Reserved   | 0x00 |
| 8  | -  | <b>Reserved</b>    | Reserved   | 0x00 |
| 7  | rw | <b>URT0_TXF</b>    | UART transmit data register empty. (set by hardware and clear by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00 |
| 6  | rw | <b>URT0_RXF</b>    | UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to the shadow buffer threshold URTx_RX_TH setting, this flag is set   | 0x00 |

|   |    |                  |   |      |
|---|----|------------------|---|------|
|   |    |                  | and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   |      |
| 5 | r  | <b>URT0_RXDF</b> | UART received data byte number is different from previous received data byte number for URTx_RDAT register. (set and clear by hardware)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 4 | rw | <b>URT0_LSF</b>  | UART line statue flag for break condition, idle line, CTS detect. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 3 | rw | <b>URT0_ERRF</b> | UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 2 | rw | <b>URT0_TCF</b>  | UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 1 | rw | <b>URT0_UGF</b>  | UART general event flag. It indicates each of URTx_SADRF , URTx_BRTF , URTx_TMOF or URTx_CALCIF flag is asserted when this flag is set. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 0 | rw | <b>URT0_RHF</b>  | UART receive hold flag. It indicates one of hardware hold event is happened when this flag is set. In the condition, the shift buffer is held and do not load data to shadow buffer until this bit is cleared. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00 |

### 1.16.2. UART interrupt enable register

| Bit    | Attr | Bit Name       | Description  | Reset |
|--------|------|----------------|--|-------|
| 31..28 | rw   | URT0_CALTMO_TH | UART calibration timeout detect threshold value for TMO counter value comparison. When the TMO counter over the threshold, the calibration timeout is happened. The timeout threshold equals (register value)*BASE. When URT0_BR_MDS sets 'Separated', the BASE value is 0x10 and value 0 indicates counter overflow value 0xFF. When URT0_BR_MDS sets 'Combined', the BASE value is 0x100 and value 0 indicates counter overflow value 0xFFF. When calibration has finished, the TMO counter value will be copied to update the baud-rate generator BRO timer. If calibration timeout is happened, the BRO timer will keep the old baud-rate setting. | 0x00  |
| 27..24 | rw   | URT0_BKTMO_TH  | UART receive Break timeout detect threshold value by using receive bit time. The timeout threshold is starting after URTx_BKF bit asserting when hardware detect a Break character. Value 0 indicates 1 bit time.  | 0x00  |
| 23..16 | rw   | URT0_RXTMO_TH  | UART RX data buffer timeout detect threshold value by using receive bit time. The timeout threshold is starting after STOP bit of the last character. The timeout threshold equal (register value+1)*8 (receive bit time) and value 0 indicates 8 bits time.   | 0x00  |
| 15     | rw   | URT0_TMO_LCK   | UART timeout timer timeout signal initial state control. When  | 0x00  |

|        |    |                       |  |      |
|--------|----|-----------------------|--|------|
|        |    |                       | locked, disables the register bit write access. Hardware auto clear after register write access.<br>0 = Locked<br>1 = Un-Locked  |      |
| 14     | rw | <b>URTO_TMO_STA</b>   | UART timeout timer timeout signal initial state. The bit is written effectively only by written 1 to URTx_TMO_LCK simultaneously.<br>0 = 0 (Output 0)<br>1 = 1 (Output 1)  | 0x00 |
| 13..11 | -  | <b>Reserved</b>       | Reserved   | 0x00 |
| 10..8  | rw | <b>URTO_TMO_CKS</b>   | UART timeout timer clock source select. When URTx_TMO_MDS selects 'UART' mode, this register must select CK_URT <sub>x</sub> _BIT(UART) as TMO timer clock for normal operation. When selects 'Noise' and sets URTx_TMO_EN=1, the number of received noise bit is able to read from URTx_TMO_CNT.<br>0x0 = UART (CK_URT <sub>x</sub> _BIT clock)<br>0x1 = Input (CK_UART clock input)<br>0x2 = Noise (Noise bit receive event)<br>0x3 = Reserved | 0x00 |
| 7      | rw | <b>URTO_CALTMO_EN</b> | UART Calibration timeout detection enable bit. When enables and URTx_CAL_AUTO=1 if Break condition has detected, chip will trigger timer-out timer to start counting. After the Calibration timeout detection and the corrected auto-sync-field has not received, UART will assert Calibration timeout flag and do not update the BR counter reload value of calibration result.<br>0 = Disable<br>1 = Enable                                    | 0x00 |
| 6      | rw | <b>URTO_BKTMO_EN</b>  | UART Break timeout detection enable bit. When enables and Break condition has detected, chip will trigger time-out timer to start counting. After Break timeout detection, UART will assert Break timeout flag.<br>0 = Disable<br>1 = Enable   | 0x00 |
| 5      | rw | <b>URTO_RXTMO_EN</b>  | UART RX timeout enable bit for shadow buffer data loading into URTx_RDAT. When timeout happened and shadow buffer storing data >=1 byte, chip will load shadow buffer into URTx_RDAT register even though it is not over the receive threshold URTx_RX_TH. User can read data to speed process.<br>0 = Disable<br>1 = Enable   | 0x00 |
| 4      | rw | <b>URTO_IDTMO_EN</b>  | UART Idle timeout detection enable bit. When enables and Idle timeout has detected, UART will assert idle timeout flag. The time is starting after STOP bit of the last character. (for SmartCard maximum guard-time)<br>0 = Disable<br>1 = Enable   | 0x00 |
| 3..2   | rw | <b>URTO_TMO_MDS</b>   | UART timeout timer mode select. When selects general timer, the timer auto reload function is enabled and URTx_IDTMO_TH is used as the auto reload register.<br>0x0 = UART : UART timeout timer<br>0x1 = General : general using timer   | 0x00 |

| 23..19 | -    | Reserved       | Reserved  | 0x00  |
| 18     | rw   | URTO_MUTE_AEX2 | UART auto exit mute mode and receive data by idle line detection enable bit. When UART enters mute mode and this bit enables, it will disable mute condition and exit mute mode if has detected the defined idle-line by setting threshold timer in URTx_DET_IDL.<br>0 = Disable<br>1 = Enable  | 0x00  |
| 17     | rw   | URTO_MUTE_AEX1 | UART auto exit mute mode and receive data by Break condition detection enable bit. When UART enters mute mode and this bit enables, it will disable mute condition and exit mute mode if has detected Break condition.<br>0 = Disable<br>1 = Enable   | 0x00  |
| 16     | rw   | URTO_MUTE_AEXO | UART auto exit mute mode and receive data by multi-processor slave address matched condition enable bit.. When UART enters mute mode and this bit enables, it will disable mute condition and exit mute mode if has received the defined address in URTx_SADR(URTx_MDS=0x2 or 0x3).(Default 1)<br>0 = Disable<br>1 = Enable   | 0x01  |
| 15..10 | -    | Reserved       | Reserved  | 0x00  |
| 9      | rw   | URTO_MUTE_AEN1 | UART mute mode auto enter by idle line detection enable bit. When enables auto mode, UART will enter mute mode after detect the defined idle-line by setting threshold timer in URTx_DET_IDL.<br>0 = Disable<br>1 = Enable  | 0x00  |
| 8      | rw   | URTO_MUTE_AENO | UART mute mode auto enter by multi-processor slave address unmatched condition enable bit. When enables auto mode, UART will enter mute mode after received the unmatched address in URTx_SADR(URTx_MDS=0x2 or 0x3).<br>0 = Disable<br>1 = Enable   | 0x01  |
| 7..1   | -    | Reserved       | Reserved  | 0x00  |
| 0      | rw   | URTO_MUTE_EN   | UART mute mode enable. When enables, only receives the characters those are idle-line for multi-processor Idle-line mode , data with address bit for multi-processor Address-bit mode or break condition for UART auto calibration mode. Also, the non-address or non-break characters are not received and does not assert the URTx_RXF interrupt. If an address is received, user software can validate the address and reset this bit to continue receiving data.<br>0 = Disable<br>1 = Enable | 0x00  |

| Bit    | Attr | Bit Name     | Description   | Reset |
|--------|------|--------------|---|-------|
| 31     | -    | Reserved     | Reserved  | 0x00  |
| 30     | rw   | URT1_CALTMOF | UART auto baud-rate calibration sync field receive time-out time out flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00  |
| 29     | rw   | URT1_BKTMOF  | UART break receive time out flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00  |
| 28     | rw   | URT1_IDTMOF  | UART idle state time out flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   | 0x00  |
| 27     | rw   | URT1_RXTMOF  | UART receive time out flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00  |
| 26..25 | -    | Reserved     | Reserved  | 0x00  |
| 24     | rw   | URT1_TXEF    | UART TX error detect flag. (set by hardware and clear by software writing 1) Refer to the register descriptions of URTx_TXE_MDS for detail.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00  |
| 23     | rw   | URT1_ROVRF   | UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00  |
| 22     | rw   | URT1_NCEF    | UART receive noised character error flag. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00  |
| 21     | rw   | URT1_FEF     | UART frame error flag. (set by hardware and clear by software writing 1)  | 0x00  |

|    |    |                    |  |      |
|----|----|--------------------|--|------|

| 7  | rw | <b>URT1_TXF</b>    | UART transmit data register empty. (set by hardware and clear by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00 |
| 6  | rw | <b>URT1_RXF</b>    | UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to the shadow buffer threshold URTx_RX_TH setting, this flag is set   | 0x00 |

|   |    |                  |   |      |
|---|----|------------------|---|------|
|   |    |                  | and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging.<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)   |      |
| 5 | r  | <b>URT1_RXDF</b> | UART received data byte number is different from previous received data byte number for URTx_RDAT register. (set and clear by hardware)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 4 | rw | <b>URT1_LSF</b>  | UART line statue flag for break condition, idle line, CTS detect. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 3 | rw | <b>URT1_ERRF</b> | UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 2 | rw | <b>URT1_TCF</b>  | UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 1 | rw | <b>URT1_UGF</b>  | UART general event flag. It indicates each of URTx_SADRF , URTx_BRTF , URTx_TMOF or URTx_CALCIF flag is asserted when this flag is set. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened)  | 0x00 |
| 0 | rw | <b>URT1_RHF</b>  | UART receive hold flag. It indicates one of hardware hold event is happened when this flag is set. In the condition, the shift buffer is held and do not load data to shadow buffer until this bit is cleared. (set by hardware and clear by software writing 1)<br>0 = Normal (No event occurred)<br>1 = Happened (Event happened) | 0x00 |

| Bit    | Attr | Bit Name       | Description  | Reset |
|--------|------|----------------|--|-------|
| 31..28 | rw   | URT1_CALTMO_TH | UART calibration timeout detect threshold value for TMO counter value comparison. When the TMO counter over the threshold, the calibration timeout is happened. The timeout threshold equals (register value)*BASE. When URT0_BR_MDS sets 'Separated', the BASE value is 0x10 and value 0 indicates counter overflow value 0xFF. When URT0_BR_MDS sets 'Combined', the BASE value is 0x100 and value 0 indicates counter overflow value 0xFFF. When calibration has finished, the TMO counter value will be copied to update the baud-rate generator BRO timer. If calibration timeout is happened, the BRO timer will keep the old baud-rate setting. | 0x00  |
| 27..24 | rw   | URT1_BKTMO_TH  | UART receive Break timeout detect threshold value by using receive bit time. The timeout threshold is starting after URTx_BKF bit asserting when hardware detect a Break character. Value 0 indicates 1 bit time.  | 0x00  |
| 23..16 | rw   | URT1_RXTMO_TH  | UART RX data buffer timeout detect threshold value by using receive bit time. The timeout threshold is starting after STOP bit of the last character. The timeout threshold equal (register value+1)*8 (receive bit time) and value 0 indicates 8 bits time.   | 0x00  |
| 15     | rw   | URT1_TMO_LCK   | UART timeout timer timeout signal initial state control. When locked, disables the register bit write access. Hardware auto clear after register write access.<br>0 = Locked<br>1 = Un-Locked  | 0x00  |
| 14     | rw   | URT1_TMO_STA   | UART timeout timer timeout signal initial state. The bit is written  | 0x00  |

|        |    |                |  |      |
|--------|----|----------------|--|------|
|        |    |                | effectively only by written 1 to URTx_TMO_LCK simultaneously.<br>0 = 0 (Output 0)<br>1 = 1 (Output 1)  |      |
| 13..11 | -  | Reserved       | Reserved   | 0x00 |
| 10..8  | rw | URT1_TMO_CKS   | UART timeout timer clock source select. When URTx_TMO_MDS selects 'UART' mode, this register must select CK_URT <sub>x</sub> _BIT(UART) as TMO timer clock for normal operation. When selects 'Noise' and sets URTx_TMO_EN=1, the number of received noise bit is able to read from URTx_TMO_CNT.<br>0x0 = UART (CK_URT <sub>x</sub> _BIT clock)<br>0x1 = Input (CK_UART clock input)<br>0x2 = Noise (Noise bit receive event)<br>0x3 = Reserved | 0x00 |
| 7      | rw | URT1_CALTMO_EN | UART Calibration timeout detection enable bit. When enables and URTx_CAL_AUTO=1 if Break condition has detected, chip will trigger timer-out timer to start counting. After the Calibration timeout detection and the corrected auto-sync-field has not received, UART will assert Calibration timeout flag and do not update the BR counter reload value of calibration result.<br>0 = Disable<br>1 = Enable                                    | 0x00 |
| 6      | rw | URT1_BKTMO_EN  | UART Break timeout detection enable bit. When enables and Break condition has detected, chip will trigger time-out timer to start counting. After Break timeout detection, UART will assert Break timeout flag.<br>0 = Disable<br>1 = Enable   | 0x00 |
| 5      | rw | URT1_RXTMO_EN  | UART RX timeout enable bit for shadow buffer data loading into URTx_RDAT. When timeout happened and shadow buffer storing data >=1 byte, chip will load shadow buffer into URTx_RDAT register even though it is not over the receive threshold URTx_RX_TH. User can read data to speed process.<br>0 = Disable<br>1 = Enable   | 0x00 |
| 4      | rw | URT1_IDTMO_EN  | UART Idle timeout detection enable bit. When enables and Idle timeout has detected, UART will assert idle timeout flag. The time is starting after STOP bit of the last character. (for SmartCard maximum guard-time)<br>0 = Disable<br>1 = Enable   | 0x00 |
| 3..2   | rw | URT1_TMO_MDS   | UART timeout timer mode select. When selects general timer, the timer auto reload function is enabled and URTx_IDTMO_TH is used as the auto reload register.<br>0x0 = UART (UART timeout timer)<br>0x1 = General (general timer)   | 0x00 |
| 1      | rw | URT1_TMO_RST   | UART timeout timer force reset enable. (set by software and clear by hardware)<br>0 = Disable<br>1 = Enable  | 0x00 |
| 0      | rw | URT1_TMO_EN    | UART timeout timer enable.<br>0 = Disable<br>1 = Enable  | 0x00 |

| 15..8  | rw   | URT1_SA_MSK | UART multi-processor slave address mask register. URTx_SA_RX register is combined with URTx_SA_MSK register to form Given/Broadcast Address for automatic address recognition. In fact, URTx_SA_MSK functions as the 'mask' register for URTx_SA_RX register. The slave address is created by taking the logical OR of URTx_SA_RX and URTx_SA_MSK. Zero in this result is considered as 'don't care'. (Value 0x00 indicates to enter multi-processor monitor mode.) | 0x00  |
| 7..0   | rw   | URT1_SA_RX  | UART multi-processor mode received slave address. When URTx_MDS select multi-processor mode and URTx_SA_MSK=0x00, UART enter multi-processor monitor mode and the input slave address value can be read from URTx_RCAP register.  | 0x00  |

| 23..19 | -    | Reserved       | Reserved  | 0x00  |
| 18     | rw   | URT1_MUTE_AEX2 | UART auto exit mute mode and receive data by idle line detection enable bit. When UART enters mute mode and this bit enables, it will disable mute condition and exit mute mode if has detected the defined idle-line by setting threshold timer in URTx_DET_IDL.<br>0 = Disable<br>1 = Enable  | 0x00  |
| 17     | rw   | URT1_MUTE_AEX1 | UART auto exit mute mode and receive data by Break condition detection enable bit. When UART enters mute mode and this bit enables, it will disable mute condition and exit mute mode if has detected Break condition.<br>0 = Disable<br>1 = Enable   | 0x00  |
| 16     | rw   | URT1_MUTE_AEX0 | UART auto exit mute mode and receive data by multi-processor slave address matched condition enable bit.. When UART enters mute mode and this bit enables, it will disable mute condition and exit mute mode if has received the defined address in URTx_SADR(URTx_MDS=0x2 or 0x3).(Default 1)<br>0 = Disable<br>1 = Enable   | 0x01  |
| 15..10 | -    | Reserved       | Reserved  | 0x00  |
| 9      | rw   | URT1_MUTE_AEN1 | UART mute mode auto enter by idle line detection enable bit. When enables auto mode, UART will enter mute mode after detect the defined idle-line by setting threshold timer in URTx_DET_IDL.<br>0 = Disable<br>1 = Enable  | 0x00  |
| 8      | rw   | URT1_MUTE_AEN0 | UART mute mode auto enter by multi-processor slave address unmatched condition enable bit. When enables auto mode, UART will enter mute mode after received the unmatched address in URTx_SADR(URTx_MDS=0x2 or 0x3).<br>0 = Disable<br>1 = Enable   | 0x01  |
| 7..1   | -    | Reserved       | Reserved  | 0x00  |
| 0      | rw   | URT1_MUTE_EN   | UART mute mode enable. When enables, only receives the characters those are idle-line for multi-processor Idle-line mode , data with address bit for multi-processor Address-bit mode or break condition for UART auto calibration mode. Also, the non-address or non-break characters are not received and does not assert the URTx_RXF interrupt. If an address is received, user software can validate the address and reset this bit to continue receiving data.<br>0 = Disable<br>1 = Enable | 0x00  |

## 2. Revision History

| <b>Version 1.53 Register Definitions (2023_1025)</b> |  |
|--|--|
| 1  | Add descriptions about DMA channel-0 using only for DMA_FGBUS_SEL=1.   |
| <b>Version 1.52 Register Definitions (2022_1109)</b> |  |
| 1  | Change the [Attr] from "w" to "rw" for bits of URTx_RDAT_INV and URTx_TDAT_INV.                              |
| <b>Version 1.51 Register Definitions (2021_0806)</b> |  |
| 1  | Update the register value definitions of PW_WKSTP_DSEL.  |
| <b>Version 1.5 Register Definitions (2021_0331)</b>  |  |
| 1  | Change register attribute from "rw" to "w" in RTC_OUT_STA.   |
| <b>Version 1.4 Register Definitions (2020_1014)</b>  |  |
| 1  | Update URTx_ECK_CKS register is only used to select the external clock input for URT0/1.                     |
| 2  | Update the register descriptions in DMA_CH0_NUM, DMA_CH0_CNT.  |
| 3  | Remove RST_PC_DIS0, RST_PC_DIS1 (registers are no effect).   |
| 4  | Change PA_OUT/PB_OUT/PC_OUT/PD_OUT[31..16] default from 0x0000 to 0xFFFF.                                    |
| 5  | Add register description about the default value is affected by CFG register in PC_AFS4/5/6/13/14 registers. |
| 6  | Update the register descriptions in RTC_RLR.   |
| 7  | Update the register descriptions in TM00_MDS, TM01_MDS.  |
| 8  | Add "The value 0 is invalid." description in URTx_DET_IDL for URT0/1.  |
| 9  | Add descriptions about SWD debugging in I2Cx_RXF, SPI0_RXF and URTx_RXF registers.                           |
| 10   | Modify the PGA gain formula in ADC0_GAIN_PGA.  |
| 11   | Remove TM36_CC3_MDS 0x6, 0x7 definitions (16bit_PWM_DTG, 8bitx2_PWM_DTG).                                    |
| 12   | Update the register description of URTx_RX_EN (add "URTx_DAT_LINE sets 1-line").                             |
| <b>Version 1.3 Register Definitions (2019_1220)</b>  |  |
| 1  | Update the register descriptions in SPI0_NSS_IDT.  |
| 2  | Update the register descriptions in RTC_RLR.   |
| <b>Version 1.2 Register Definitions (2019_0926)</b>  |  |
| 1  | Update the register descriptions in RTC_ALM register.  |
| 2  | Change default value to 0 for PC_IN, PC_SCR0/1/2/3 registers.  |
| 3  | Change default value of CFG_BOD1_TH, CFG_ISP_SIZE, CFG_IWDT_DIV registers.                                   |
| 4  | Remove ADC0_REFT, ADC0_REFM, ADC0_REFB, ADC0_CAL_AZEN registers.   |
| 5  | Change hysteresis from 5 to 10mv in CMP_AC0_HYS, CMP_AC1_HYS registers.                                      |

| <b>Version 1.1 Register Definitions (2019_0729)</b> |   |
|---|---|
| 1   | Correct value definition string "IN 1" to "IN1" for TMx_CKE_SEL, TMx_TRG_MUX registers. |
| 2   | Update the register descriptions in SPI0_DOUT_MDS register.                             |
| 3   | Remove CFG_OR15 register.   |
| <b>Version 1.0 Register Definitions (2019_0510)</b> |   |
| 1   | Initial version for register definitions  |

### 3. List of abbreviations for registers

| Abbreviations         | Definition        | Descriptions   |
|-----------------------|-------------------|--|
| <b>Attr</b>           | access Attribute  | Register read/write access attribute   |
| <b>rw</b>             | Read/Writer       | Indicate the register can be read or write by software.  |
| <b>r</b>              | Read              | Indicate the register can be read only by software.  |
| <b>w</b>              | Write             | Indicate the register can be written only by software.   |
| <b>Reserved</b>       | Reserved register | Indicate the register is reserved for internal using or future design.   |
| <b>Reset</b>          | Reset value       | The register default value after chip warm/cold reset by design default or loaded from OB(option byte flash)   |
| <b>Base Address</b>   | absolute address  | The Base Address is using as the absolute address of CPU addressing for all the registers of a module. The actual address of a register is the Base Address plus the Offset Address. |
| <b>Offset Address</b> | related address   | The Offset Address is using as the related address for one of the registers of a module. The actual address of a register is the Base Address plus the Offset Address.               |
