## ***Register Definition Guide***

***Version 1.04***

***Date 2025/10/14***

## List of Contents

<b>1. Registers .....</b>	<b>18</b>
1.1. IO Port Control Registers .....	18
1.1.1. PA output data register .....	18
1.1.2. PA input data register.....	18
1.1.3. PA port set / clear register.....	19
1.1.4. PA port set and clear register 0.....	20
1.1.5. PA port set and clear register 1.....	20
1.1.6. PA port set and clear register 2.....	21
1.1.7. PA port set and clear register 3.....	21
1.1.8. PB output data register .....	22
1.1.9. PB input data register.....	22
1.1.10. PB port set / clear register.....	23
1.1.11. PB port set and clear register 0.....	24
1.1.12. PB port set and clear register 1.....	24
1.1.13. PB port set and clear register 2.....	25
1.1.14. PB port set and clear register 3.....	25
1.1.15. PC output data register .....	26
1.1.16. PC input data register .....	27
1.1.17. PC port set / clear register .....	27
1.1.18. PC port set and clear register 0 .....	28
1.1.19. PC port set and clear register 1 .....	29
1.1.20. PC port set and clear register 2 .....	29
1.1.21. PC port set and clear register 3 .....	30
1.1.22. PD output data register .....	30
1.1.23. PD input data register .....	31
1.1.24. PD port set / clear register .....	31
1.1.25. PD port set and clear register 0 .....	32
1.1.26. PD port set and clear register 1 .....	33
1.1.27. PD port set and clear register 2 .....	33
1.1.28. PD port set and clear register 3 .....	34
1.1.29. PE output data register .....	34
1.1.30. PE input data register.....	35
1.1.31. PE port set / clear register.....	35
1.1.32. PE port set and clear register 0.....	36
1.1.33. PE port set and clear register 2.....	37
1.1.34. PE port set and clear register 3.....	37
1.1.35. IOP Register Map .....	39
1.2. Port A Configure Registers .....	43
1.2.1. PA0 IO control register.....	43
1.2.2. PA1 IO control register.....	44
1.2.3. PA2 IO control register.....	45
1.2.4. PA3 IO control register.....	46
1.2.5. PA4 IO control register.....	47
1.2.6. PA5 IO control register.....	48
1.2.7. PA6 IO control register.....	49

1.2.8. PA7 IO control register.....	50
1.2.9. PA8 IO control register.....	51
1.2.10. PA9 IO control register.....	52
1.2.11. PA10 IO control register.....	53
1.2.12. PA11 IO control register.....	54
1.2.13. PA12 IO control register.....	55
1.2.14. PA13 IO control register.....	56
1.2.15. PA14 IO control register.....	57
1.2.16. PA15 IO control register.....	58
1.2.17. PA port input filter control register.....	59
1.2.18. PA Register Map.....	60
1.3. Port B Configure Registers.....	62
1.3.1. PB0 IO control register.....	62
1.3.2. PB1 IO control register.....	63
1.3.3. PB2 IO control register.....	64
1.3.4. PB3 IO control register.....	65
1.3.5. PB4 IO control register.....	66
1.3.6. PB5 IO control register.....	67
1.3.7. PB6 IO control register.....	68
1.3.8. PB7 IO control register.....	69
1.3.9. PB8 IO control register.....	70
1.3.10. PB9 IO control register.....	71
1.3.11. PB10 IO control register.....	72
1.3.12. PB11 IO control register.....	73
1.3.13. PB12 IO control register.....	74
1.3.14. PB13 IO control register.....	75
1.3.15. PB14 IO control register.....	76
1.3.16. PB15 IO control register.....	77
1.3.17. PB port input filter control register.....	78
1.3.18. PB Register Map.....	79
1.4. Port C Configure Registers.....	81
1.4.1. PC0 IO control register.....	81
1.4.2. PC1 IO control register.....	82
1.4.3. PC2 IO control register.....	83
1.4.4. PC3 IO control register.....	84
1.4.5. PC4 IO control register.....	85
1.4.6. PC5 IO control register.....	86
1.4.7. PC6 IO control register.....	87
1.4.8. PC7 IO control register.....	88
1.4.9. PC8 IO control register.....	89
1.4.10. PC9 IO control register.....	90
1.4.11. PC10 IO control register.....	91
1.4.12. PC11 IO control register.....	92
1.4.13. PC12 IO control register.....	93
1.4.14. PC13 IO control register.....	94
1.4.15. PC14 IO control register.....	95

1.4.16. PC port input filter control register.....	96
1.4.17. PC Register Map.....	97
1.5. Port D Configure Registers .....	99
1.5.1. PD0 IO control register.....	99
1.5.2. PD1 IO control register.....	100
1.5.3. PD2 IO control register.....	101
1.5.4. PD3 IO control register.....	102
1.5.5. PD4 IO control register.....	103
1.5.6. PD5 IO control register.....	104
1.5.7. PD6 IO control register.....	105
1.5.8. PD7 IO control register.....	106
1.5.9. PD8 IO control register.....	107
1.5.10. PD9 IO control register.....	108
1.5.11. PD10 IO control register.....	109
1.5.12. PD11 IO control register.....	110
1.5.13. PD12 IO control register.....	111
1.5.14. PD13 IO control register.....	112
1.5.15. PD14 IO control register.....	113
1.5.16. PD15 IO control register.....	114
1.5.17. PD port input filter control register.....	115
1.5.18. PD Register Map.....	116
1.6. Port E Configure Registers.....	118
1.6.1. PE0 IO control register.....	118
1.6.2. PE1 IO control register.....	119
1.6.3. PE2 IO control register.....	120
1.6.4. PE3 IO control register.....	121
1.6.5. PE8 IO control register.....	122
1.6.6. PE9 IO control register.....	123
1.6.7. PE12 IO control register.....	124
1.6.8. PE13 IO control register.....	125
1.6.9. PE14 IO control register.....	126
1.6.10. PE15 IO control register.....	127
1.6.11. PE port input filter control register.....	128
1.6.12. PE Register Map.....	129
1.7. GPL Control Registers .....	131
1.7.1. GPL status register .....	131
1.7.2. GPL control register 0 .....	131
1.7.3. GPL control register 1 .....	132
1.7.4. GPL data input register .....	133
1.7.5. GPL data output register.....	133
1.7.6. GPL CRC initial register.....	133
1.7.7. GPL Register Map .....	134
1.8. DMA Control Registers.....	135
1.8.1. DMA status register .....	135
1.8.2. DMA interrupt enable register .....	136
1.8.3. DMA global control register 0.....	137

1.8.4. DMA channel-0 control register 0.....	138
1.8.5. DMA channel-0 control register 1.....	139
1.8.6. DMA channel-0 control register 1.....	140
1.8.7. DMA channel-0 control register 1.....	141
1.8.8. DMA channel-0 source start address register.....	141
1.8.9. DMA channel-0 source current address register.....	141
1.8.10. DMA channel-0 destination start address register.....	142
1.8.11. DMA channel-0 destination current address register.....	142
1.8.12. DMA channel-1 control register 0.....	142
1.8.13. DMA channel-1 control register 1.....	144
1.8.14. DMA channel-1 control register 1.....	145
1.8.15. DMA channel-1 control register 1.....	145
1.8.16. DMA channel-1 source start address register.....	146
1.8.17. DMA channel-1 source current address register.....	146
1.8.18. DMA channel-1 destination start address register.....	146
1.8.19. DMA channel-1 destination current address register.....	147
1.8.20. DMA channel-2 control register 0.....	147
1.8.21. DMA channel-2 control register 1.....	149
1.8.22. DMA channel-2 control register 1.....	149
1.8.23. DMA channel-2 control register 1.....	150
1.8.24. DMA channel-2 source start address register.....	150
1.8.25. DMA channel-2 source current address register.....	151
1.8.26. DMA channel-2 destination start address register.....	151
1.8.27. DMA channel-2 destination current address register.....	151
1.8.28. DMA channel-3 control register 0.....	152
1.8.29. DMA channel-3 control register 1.....	153
1.8.30. DMA channel-3 control register 1.....	154
1.8.31. DMA channel-3 control register 1.....	154
1.8.32. DMA channel-3 source start address register.....	155
1.8.33. DMA channel-3 source current address register.....	155
1.8.34. DMA channel-3 destination start address register.....	156
1.8.35. DMA channel-3 destination current address register.....	156
1.8.36. DMA channel-4 control register 0.....	156
1.8.37. DMA channel-4 control register 1.....	158
1.8.38. DMA channel-4 control register 1.....	159
1.8.39. DMA channel-4 control register 1.....	159
1.8.40. DMA channel-4 source start address register.....	159
1.8.41. DMA channel-4 source current address register.....	160
1.8.42. DMA channel-4 destination start address register.....	160
1.8.43. DMA channel-4 destination current address register.....	160
1.8.44. DMA Register Map.....	162
1.9. Reset Control Registers.....	167
1.9.1. RST Reset status register.....	167
1.9.2. RST write protected Key register.....	168
1.9.3. RST control register 0.....	169
1.9.4. RST Cold reset enable register.....	170

1.9.5. RST Warm reset enable register.....	171
1.9.6. RST AHB reset register.....	173
1.9.7. RST APB reset register 0.....	173
1.9.8. RST APB reset register 1.....	175
1.9.9. RST Register Map .....	176
1.10. Clock Control Registers.....	177
1.10.1. CSC status register .....	177
1.10.2. CSC interrupt enable register.....	178
1.10.3. CSC OSC and PLL control register.....	179
1.10.4. CSC write protected Key register .....	180
1.10.5. CSC clock source control register 0.....	180
1.10.6. CSC clock divider register .....	181
1.10.7. CSC AHB clock control register .....	182
1.10.8. CSC APB clock control register 0 .....	183
1.10.9. CSC APB clock control register 1 .....	185
1.10.10. CSC SLEEP mode clock enable register 0 .....	185
1.10.11. CSC SLEEP mode clock enable register 1 .....	187
1.10.12. CSC STOP mode clock enable register 0 .....	188
1.10.13. CSC clock source select register 0 .....	189
1.10.14. CSC clock source select register 1 .....	189
1.10.15. CSC clock source select register 2 .....	190
1.10.16. CSC Register Map .....	192
1.11. Power Control Registers .....	194
1.11.1. PW status register.....	194
1.11.2. PW interrupt enable register .....	195
1.11.3. PW write protected Key register.....	195
1.11.4. PW control register 0.....	196
1.11.5. PW control register 1.....	197
1.11.6. PW STOP mode wakeup control register 0.....	198
1.11.7. PW STOP mode wakeup control register 1.....	199
1.11.8. PW Register Map .....	201
1.12. System Control Registers.....	202
1.12.1. SYS interrupt enable register .....	202
1.12.2. SYS chip manufacture identification code.....	202
1.12.3. SYS System control register 0 .....	202
1.12.4. SYS Backup register 0 .....	203
1.12.5. SYS Register Map .....	204
1.13. Memory Control Registers.....	205
1.13.1. MEM status register .....	205
1.13.2. MEM interrupt enable register .....	205
1.13.3. MEM write protected key register.....	206
1.13.4. MEM control register 0 .....	207
1.13.5. MEM control register 1 .....	208
1.13.6. MEM Flash memory protected key register.....	209
1.13.7. MEM Flash memory IAP size register .....	209
1.13.8. MEM Register Map .....	211

1.14. Hardware Configure Registers .....	212
1.14.1. CFG write protected Key register .....	212
1.14.2. CFG option byte register 00 .....	212
1.14.3. CFG option byte register 01 .....	213
1.14.4. CFG option byte register 02 .....	213
1.14.5. CFG option byte register 03 .....	214
1.14.6. CFG option byte register 05 .....	215
1.14.7. CFG option byte register 15 .....	216
1.14.8. CFG option byte register 16 .....	216
1.14.9. CFG option byte register 17 .....	217
1.14.10. CFG Register Map .....	218
1.15. EXIC Interrupt Registers .....	220
1.15.1. EXIC interrupt status register .....	220
1.15.2. EXIC interrupt enable register .....	221
1.15.3. EXIC control register 0 .....	221
1.15.4. EXIC PA input interrupt pending flag register .....	222
1.15.5. EXIC PA Pad input trigger select register .....	224
1.15.6. EXIC PA AOI Mask register .....	225
1.15.7. EXIC PB input interrupt pending flag register .....	227
1.15.8. EXIC PB Pad input trigger select register .....	228
1.15.9. EXIC PB AOI Mask register .....	230
1.15.10. EXIC PC input interrupt pending flag register .....	232
1.15.11. EXIC PC Pad input trigger select register .....	233
1.15.12. EXIC PC AOI Mask register .....	234
1.15.13. EXIC PD input interrupt pending flag register .....	236
1.15.14. EXIC PD Pad input trigger select register .....	237
1.15.15. EXIC PD AOI Mask register .....	239
1.15.16. EXIC Interrupt source identity register 0 .....	241
1.15.17. EXIC interrupt source identity register 1 .....	241
1.15.18. EXIC interrupt source identity register 2 .....	242
1.15.19. EXIC interrupt source identity register 3 .....	243
1.15.20. EXIC interrupt source identity register 4 .....	243
1.15.21. EXIC interrupt source identity register 5 .....	244
1.15.22. EXIC interrupt source identity register 6 .....	244
1.15.23. EXIC interrupt source identity register 7 .....	245
1.15.24. EXIC PE input interrupt pending flag register .....	246
1.15.25. EXIC PE Pad input trigger select register .....	246
1.15.26. EXIC PE AOI Mask register .....	248
1.15.27. EXIC Register Map .....	250
1.16. I2C0 Control Registers .....	253
1.16.1. I2C0 status register .....	253
1.16.2. I2C0 interrupt enable register .....	255
1.16.3. I2C0 clock source register .....	256
1.16.4. I2C0 slave mode slave address code register .....	257
1.16.5. I2C0 control register 0 .....	257
1.16.6. I2C0 control register 1 .....	258

1.16.7. I2C0 control register 2 .....	259
1.16.8. I2C0 slave address detect register .....	260
1.16.9. I2C0 timeout control register .....	261
1.16.10. I2C0 status register 2 .....	261
1.16.11. I2C0 data shift buffer register .....	262
1.16.12. I2C0 data register .....	262
1.16.13. I2C0 slave address detect register .....	262
1.16.14. I2C0 Register Map .....	264
1.17. I2C1 Control Registers .....	266
1.17.1. I2C1 status register .....	266
1.17.2. I2C1 interrupt enable register .....	268
1.17.3. I2C1 clock source register .....	269
1.17.4. I2C1 slave mode slave address code register .....	269
1.17.5. I2C1 control register 0 .....	270
1.17.6. I2C1 control register 1 .....	271
1.17.7. I2C1 control register 2 .....	272
1.17.8. I2C1 slave address detect register .....	273
1.17.9. I2C1 timeout control register .....	274
1.17.10. I2C1 status register 2 .....	274
1.17.11. I2C1 data shift buffer register .....	275
1.17.12. I2C1 data register .....	275
1.17.13. I2C1 slave address detect register .....	275
1.17.14. I2C1 Register Map .....	277
1.18. URT0 Control Registers .....	279
1.18.1. URT0 status register 1 .....	279
1.18.2. UART interrupt enable register .....	281
1.18.3. URT0 clock source register .....	283
1.18.4. URT0 status register 2 .....	285
1.18.5. URT0 control register 0 .....	286
1.18.6. URT0 control register 1 .....	288
1.18.7. URT0 control register 2 .....	289
1.18.8. URT0 control register 3 .....	290
1.18.9. URT0 control register 4 .....	291
1.18.10. URT0 baud-rate clock counter reload register .....	292
1.18.11. URT0 baud-rate clock counter register .....	293
1.18.12. URT0 RX data capture register .....	293
1.18.13. URT0 RX data register .....	293
1.18.14. URT0 TX data register .....	294
1.18.15. URT0 TX data 3-byte register .....	294
1.18.16. URT0 data shift buffer register .....	294
1.18.17. URT0 timeout control register .....	295
1.18.18. URT0 timeout control register 2 .....	296
1.18.19. URT0 SmartCard control register .....	297
1.18.20. URT0 slave address detect register .....	298
1.18.21. URT0 calibration control register .....	298
1.18.22. URT0 IrDA control register .....	299

1.18.23. URT0 hardware flow control register .....	300
1.18.24. URT0 mute control register .....	300
1.18.25. URT0 Register Map .....	302
1.19. URT1 Control Registers .....	305
1.19.1. URT1 status register 1 .....	305
1.19.2. URT1 interrupt enable register .....	307
1.19.3. URT1 clock source register .....	309
1.19.4. URT1 status register 2 .....	311
1.19.5. URT1 control register 0 .....	312
1.19.6. URT1 control register 1 .....	314
1.19.7. URT1 control register 2 .....	315
1.19.8. URT1 control register 3 .....	316
1.19.9. URT1 control register 4 .....	317
1.19.10. URT1 baud-rate clock counter reload register .....	318
1.19.11. URT1 baud-rate clock counter register .....	318
1.19.12. URT1 RX data capture register .....	319
1.19.13. URT1 RX data register .....	319
1.19.14. URT1 TX data register .....	320
1.19.15. URT1 TX data 3-byte register .....	320
1.19.16. URT1 data shift buffer register .....	320
1.19.17. URT1 timeout control register .....	321
1.19.18. URT1 timeout control register 2 .....	322
1.19.19. URT1 SmartCard control register .....	323
1.19.20. URT1 slave address detect register .....	324
1.19.21. URT1 calibration control register .....	324
1.19.22. URT1 IrDA control register .....	325
1.19.23. URT1 hardware flow control register .....	325
1.19.24. URT1 mute control register .....	326
1.19.25. URT1 Register Map .....	328
1.20. URT2 Control Registers .....	331
1.20.1. URT2 status register 1 .....	331
1.20.2. URT2 interrupt enable register .....	333
1.20.3. URT2 clock source register .....	335
1.20.4. URT2 status register 2 .....	337
1.20.5. URT2 control register 0 .....	338
1.20.6. URT2 control register 1 .....	340
1.20.7. URT2 control register 2 .....	341
1.20.8. URT2 control register 3 .....	342
1.20.9. URT2 control register 4 .....	343
1.20.10. URT2 baud-rate clock counter reload register .....	344
1.20.11. URT2 baud-rate clock counter register .....	344
1.20.12. URT2 RX data capture register .....	345
1.20.13. URT2 RX data register .....	345
1.20.14. URT2 TX data register .....	346
1.20.15. URT2 TX data 3-byte register .....	346
1.20.16. URT2 data shift buffer register .....	346

1.20.17. URT2 timeout control register .....	347
1.20.18. URT2 timeout control register 2 .....	348
1.20.19. URT2 SmartCard control register.....	349
1.20.20. URT2 slave address detect register .....	350
1.20.21. URT2 calibration control register.....	350
1.20.22. URT2 IrDA control register.....	351
1.20.23. URT2 hardware flow control register.....	351
1.20.24. URT2 mute control register .....	352
1.20.25. URT2 Register Map .....	354
1.21. URT4 Control Registers .....	357
1.21.1. URT4 status register 1 .....	357
1.21.2. URT4 interrupt enable register.....	358
1.21.3. URT4 clock source register.....	359
1.21.4. URT4 status register 2 .....	360
1.21.5. URT4 control register 0 .....	361
1.21.6. URT4 control register 1 .....	362
1.21.7. URT4 control register 2.....	363

## 1. Registers

### 1.1. IO Port Control Registers

<b>IO Port Control</b>	<b>(IOP) General Purpose IO Port Control</b>
Base Address :	<b>0x41000000</b>

#### 1.1.1. PA output data register

PA_OUT	PA output data register		
Offset Address :	0x00	Reset Value :	0xFFFFFFFF

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
PA_OUT15	PA_OUT14	PA_OUT13	PA_OUT12	PA_OUT11	PA_OUT10	PA_OUT9	PA_OUT8
7	6	5	4	3	2	1	0
PA_OUT7	PA_OUT6	PA_OUT5	PA_OUT4	PA_OUT3	PA_OUT2	PA_OUT1	PA_OUT0

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0xFFFF
15	rw	PA_OUT15	IO pin PA15 output data bit.	0x01
14	rw	PA_OUT14	IO pin PA14 output data bit.	0x01
13	rw	PA_OUT13	IO pin PA13 output data bit.	0x01
12	rw	PA_OUT12	IO pin PA12 output data bit.	0x01
11	rw	PA_OUT11	IO pin PA11 output data bit.	0x01
10	rw	PA_OUT10	IO pin PA10 output data bit.	0x01

## 1.7. GPL Control Registers

<b>GPL Control</b>	<b>(GPL) General Purpose Logic Control</b>
Base Address :	<b>0x4B000000</b>

### 1.7.1. GPL status register

GPL_STA	GPL status register		
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved	GPL_PAR32_OUT	GPL_PAR16_OUT[1:0]		GPL_PAR8_OUT[3:0]			
7	6	5	4	3	2	1	0
Reserved				Reserved	Reserved	Reserved	Reserved

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15	-	Reserved	Reserved	0x00
14	r	GPL_PAR32_OUT	GPL 32-bit data parity check output.	0x00
13..12	r	GPL_PAR16_OUT	GPL 16-bit data parity check output.	0x00
11..8	r	GPL_PAR8_OUT	GPL 8-bit data parity check output.	0x00
7..3	-	Reserved	Reserved	0x00
2	-	Reserved	Reserved	0x00
1	-	Reserved	Reserved	0x00
0	-	Reserved	Reserved	0x00

### 1.7.2. GPL control register 0

GPL_CR0		GPL control register 0	
Offset Address :	0x10	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
GPL_DMA_EN	Reserved	Reserved					
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved					GPL_PAR_POL	Reserved	
7	6	5	4	3	2	1	0
Reserved	GPL_IN_INV	Reserved	GPL_BEND16_EN	GPL_BREV_MDS[1:0]		GPL_BEND_EN	Reserved

Bit	Attr	Bit Name	Description	Reset
31	rw	GPL_DMA_EN	Direct memory access enable bit. When enables, hardware can receive the data from DMA to do GPL process. 0 = Disable 1 = Enable	0x00
30	-	Reserved	Reserved	0x00
29..24	-	Reserved	Reserved	0x00
23..16	-	Reserved	Reserved	0x00
15..11	-	Reserved	Reserved	0x00
10	rw	GPL_PAR_POL	Data parity check polarity select. 0 = Even 1 = Odd	0x00
9..8	-	Reserved	Reserved	0x00
7	-	Reserved	Reserved	0x00
6	rw	GPL_IN_INV	Inverse input data enable. 0 = Disable	0x00

			1 = Enable	
5	-	Reserved	Reserved	0x00
4	rw	GPL_BEND16_EN	Data byte Big/little endian change mode enable for 16-bit range. 0 = Disable 1 = Enable	0x00
3..2	rw	GPL_BREV_MDS	Data bit order reverse change mode select. 0x0 = Disable 0x1 = 8bit : 8-bit range bit order reverse 0x2 = 16bit : 16-bit range bit order reverse 0x3 = 32bit : 32-bit range bit order reverse	0x00
1	rw	GPL_BEND_EN	Data byte Big/little endian change mode enable for 32-bit range. 0 = Disable 1 = Enable	0x00
0	-	Reserved	Reserved	0x00

### 1.7.3. GPL control register 1

<b>GPL_CR1</b>	<b>GPL control register 1</b>
Offset Address :	0x14
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							Reserved
23	22	21	20	19	18	17	16
Reserved							Reserved
15	14	13	12	11	10	9	8
Reserved						Reserved	
7	6	5	4	3	2	1	0
GPL_CRC_BREV[1:0]		GPL_CRC_DSIZE[1:0]		GPL_CRC_MDS[1:0]		Reserved	GPL_CRC_EN

Bit	Attr	Bit Name	Description	Reset
31..25	-	Reserved	Reserved	0x00
24	-	Reserved	Reserved	0x00
23..17	-	Reserved	Reserved	0x00
16	-	Reserved	Reserved	0x00
15..10	-	Reserved	Reserved	0x00
9..8	-	Reserved	Reserved	0x00
7..6	rw	GPL_CRC_BREV	CRC data output bit order reverse change mode select. 0x0 = Disable 0x1 = 8bit : 8-bit range bit order reverse 0x2 = 16bit : 16-bit range bit order reverse 0x3 = 32bit : 32-bit range bit order reverse	0x00
5..4	rw	GPL_CRC_DSIZE	CRC operation data size. When DMA enable bit is set in GPL_DMA_EN and DMA_FGBUS_SEL=0, the register is fixed 8-bit setting by hardware. When DMA enable bit is set in GPL_DMA_EN and DMA_FGBUS_SEL=1, the register is fixed 32-bit setting by hardware. 0x0 = 8bit 0x1 = 16bit 0x2 = 32bit 0x3 = Reserved	0x00
3..2	rw	GPL_CRC_MDS	CRC mode select. 0x0 = CCITT16 : polynomial 0x1021 0x1 = CRC8 : polynomial 0x07 0x2 = CRC16 : polynomial 0x8005 0x3 = CRC32 : polynomial 0x4C11DB7	0x00
1	-	Reserved	Reserved	0x00
0	rw	GPL_CRC_EN	CRC function enable bit. 0 = Disable	0x00

		1 = Enable	
--	--	------------	--

#### 1.7.4. GPL data input register

<b>GPL_DIN</b>	<b>GPL data input register</b>		
<b>Offset Address :</b>	<b>0x18</b>	<b>Reset Value :</b>	<b>0x00000000</b>

31	30	29	28	27	26	25	24
GPL_DIN[31:24]							
23	22	21	20	19	18	17	16
GPL_DIN[23:16]							
15	14	13	12	11	10	9	8
GPL_DIN[15:8]							
7	6	5	4	3	2	1	0
GPL_DIN[7:0]							

Bit	Attr	Bit Name	Description	Reset
31..0	rw	GPL_DIN	GPL data input register. For write operation, this register is used to write new calculation data.	0x00000000

#### 1.7.5. GPL data output register

GPL_DOUT	GPL data output register		
Offset Address :	0x1C	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
GPL_DOUT[31:24]							
23	22	21	20	19	18	17	16
GPL_DOUT[23:16]							
15	14	13	12	11	10	9	8
GPL_DOUT[15:8]							
7	6	5	4	3	2	1	0
GPL_DOUT[7:0]							

Bit	Attr	Bit Name	Description	Reset
31..0	r	GPL_DOUT	GPL data output register.	0x00000000

#### 1.7.6. GPL CRC initial register

<b>GPL_CRCINIT</b>	<b>GPL CRC initial register</b>		
Offset Address :	<b>0x24</b>	Reset Value :	<b>0x00000000</b>

31	30	29	28	27	26	25	24
GPL_CRC_INIT[31:24]							
23	22	21	20	19	18	17	16
GPL_CRC_INIT[23:16]							
15	14	13	12	11	10	9	8
GPL_CRC_INIT[15:8]							
7	6	5	4	3	2	1	0
GPL_CRC_INIT[7:0]							

Bit	Attr	Bit Name	Description	Reset
31..0	rw	GPL_CRC_INIT	Programmable initial CRC value. The CRC calculator data can be initialized to this value by write operation for this register. This register needs to be initialized every time doing CRC process.	0x00000000

## 1.7.7. GPL Register Map

GPL Register Map

7	6	5	4	3	2	1	0
Reserved	DMA_CH4_LAST	Reserved		DMA_CH4_ADSEL	DMA_CH4_LOOP	DMA_CH4_HOLD	DMA_CH4_EN

Bit	Attr	Bit Name	Description	Reset
31..28	-	Reserved	Reserved	0x00
27	rw	DMA_CH4_ERR2F	DMA channel-4 transfer error flag. This bit is same as DMA_CH4_ERRF. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred)	0x00

			1 = Happened (reset event happened)	
26	rw	<b>DMA_CH4_TH2F</b>	DMA channel-4 transfer half flag. This bit is same as DMA_CH4_THF .(set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (reset event happened)	0x00
25	rw	<b>DMA_CH4_TC2F</b>	DMA channel-4 transfer complete flag. This bit is same as DMA_CH4_TCF. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (reset event happened)	0x00
24	-	<b>Reserved</b>	Reserved	0x00
23..20	-	<b>Reserved</b>	Reserved	0x00
19	rw	<b>DMA_CH4_EIE</b>	DMA channel-4 transfer error interrupt enable. 0 = Disable 1 = Enable	0x00
18	rw	<b>DMA_CH4_HIE</b>	DMA channel-4 transfer half interrupt enable. 0 = Disable 1 = Enable	0x00
17	rw	<b>DMA_CH4_CIE</b>	DMA channel-4 transfer complete interrupt enable. 0 = Disable 1 = Enable	0x00
16	-	<b>Reserved</b>	Reserved	0x00
15	rw	<b>DMA_CH4_REQ</b>	DMA channel data transfer request enable. This bit is auto clear by hardware after transfer complete. 0 = No : no effect 1 = Enable	0x00
14	-	<b>Reserved</b>	Reserved	0x00
13..12	rw	<b>DMA_CH4_BSIZE</b>	DMA transfer burst size. Indicates the number of transfers that make up a single DMA data transfer. This value must be set to the data size of the peripheral. For example, set Two or Four for ADC 16-bit or 32-bit data transfer setting. 0x0 = One 0x1 = Two 0x2 = Reserved 0x3 = Four	0x00
11..10	rw	<b>DMA_CH4_PLS</b>	DMA channel priority level select. 0x0 = LV0 : lowest priority 0x1 = LV1 : normal priority 0x2 = LV2 : high priority 0x3 = LV3 : highest priority	0x00
9..8	rw	<b>DMA_CH4_XMDS</b>	DMA channel external pin trigger request mode select. When selects value 1~3, the DMA request is forced from external pin and disables internal peripheral connections or software request by DMA_CHn_REQ setting. (n=channel index) 0x0 = Disable : disable external request pin input 0x1 = Single : single request mode 0x2 = Block : block request mode 0x3 = Demand : demand request mode(active high)	0x00
7	-	<b>Reserved</b>	Reserved	0x00
6	rw	<b>DMA_CH4_LAST</b>	DMA Channel last loop command. When the DMA channel is enabled the loop mode, this bit is set to command DMA controller to indicate the next loop is the last loop. This bit is set by software and hardware cleared after last loop DMA process finished. 0 = Not 1 = Yes	0x00
5..4	-	<b>Reserved</b>	Reserved	0x00
3	rw	<b>DMA_CH4_ADSEL</b>	DMA address increased mode select. When selects Skip3 mode, the Lsb word address is increased from 0 to 1, 1 to 2, 2 to 0 and skip address 3.	0x00

			0 = Normal : sequential increment 1 1 = SKIP3 : address increment from 0 to 1,2 then return 0	
2	rw	<b>DMA_CH4_LOOP</b>	DMA loop mode enable. When enables, the number of transaction data is automatically reloaded with the initial value in DMA_CHn_NUM and the DMA requests will be continuous. Also the source and destination memory transfer current address counters are automatically reloaded with the initial value in DMA_CHn_SSA and DMA_CHn_DSA. (n=channel index) 0 = Disable 1 = Enable	0x00
1	rw	<b>DMA_CH4_HOLD</b>	DMA channel operation hold enable. When enables, the DMA transfer operation is hold until this bit is disabled. The hold function is no effect for external pin trigger request mode. 0 = Disable 1 = Enable	0x00
0	rw	<b>DMA_CH4_EN</b>	DMA channel operation enable. When enables, this channel can be configure. When disables, this channel will be reset. 0 = Disable 1 = Enable	0x00

### 1.8.37. DMA channel-4 control register 1

<b>DMA_CH4B</b>	<b>DMA channel-4 control register 1</b>
Offset Address :	<b>0xA4</b>
Reset Value :	<b>0x00030000</b>

## 1.12. System Control Registers

<b>System Control</b>	<b>(SYS) System and Chip Control</b>
Base Address :	<b>0x4C030000</b>

### 1.12.1. SYS interrupt enable register

SYS_INT	SYS interrupt enable register		
Offset Address :	0x04	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							<b>SYS_IEA</b>

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..8	-	Reserved	Reserved	0x00
7..1	-	Reserved	Reserved	0x00
0	rw	<b>SYS_IEA</b>	System interrupt all enable. When disables, the INT_SYS global all interrupt event are disabled. When enables, the related event interrupt enable bit is to enable or disable the interrupt. 0 = Disable 1 = Enable	0x00

### 1.12.2. SYS chip manufacture identification code

SYS_MID	SYS chip manufacture identification code		
Offset Address :	0x0C	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
<b>SYS_MID[31:24]</b>							
23	22	21	20	19	18	17	16
<b>SYS_MID[23:16]</b>							
15	14	13	12	11	10	9	8
<b>SYS_MID[15:8]</b>							
7	6	5	4	3	2	1	0
<b>SYS_MID[7:0]</b>							

Bit	Attr	Bit Name	Description	Reset
31..0	r	<b>SYS_MID</b>	Chip manufacture identification code.	0x00000000

### 1.12.3. SYS System control register 0

SYS_CR0		SYS System control register 0	
Offset Address :	0x10	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
<b>SYS_GPR[7:0]</b>							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23..16	rw	SYS_GPR	General purpose data register bits.	0x00
15..8	-	Reserved	Reserved	0x00
7..0	-	Reserved	Reserved	0x00

#### 1.12.4. SYS Backup register 0

SYS_BKP0	SYS Backup register 0
Offset Address :	0x20
Reset Value :	0xFFFFFFFF

31	30	29	28	27	26	25	24
SYS_BKP0[31:24]							
23	22	21	20	19	18	17	16
SYS_BKP0[23:16]							
15	14	13	12	11	10	9	8
SYS_BKP0[15:8]							
7	6	5	4	3	2	1	0
SYS_BKP0[7:0]							

Bit	Attr	Bit Name	Description	Reset
31..0	rw	SYS_BKP0	This register is used for application firmware without any hardware control. It can be written or read but not reset by POR or other cold/warm reset.	0xFFFFFFFF

## 1.12.5. SYS Register Map

## 1.16. I2C0 Control Registers

<b>I2C0 Control</b>	<b>(I2C0) I2C Control Module-0</b>
Base Address :	<b>0x51000000</b>

## 1.16.1. I2C0 status register

I2C0_STA	I2C0 status register		
Offset Address :	0x00	Reset Value :	0x00000080

31	30	29	28	27	26	25	24
Reserved							Reserved
23	22	21	20	19	18	17	16
I2C0_BERRF	I2C0_ALOSF	I2C0_NACKF	I2C0_TOVRF	I2C0_ROVRF	I2C0_TXRF	I2C0_STPSTRF	I2C0_TSCF
15	14	13	12	11	10	9	8
I2C0_RWF	I2C0_MSTF	I2C0_SLAF	I2C0_SADRF	I2C0_ERRCF	I2C0_CNTF	I2C0_STOPF	I2C0_RSTRF
7	6	5	4	3	2	1	0
I2C0_TXF	I2C0_RXF	I2C0_WUPF	I2C0_TMOUTF	I2C0_ERRF	I2C0_BUFF	I2C0_EVENTF	I2C0_BUSYF

Bit	Attr	Bit Name	Description	Reset
31..25	-	Reserved	Reserved	0x00
24	-	Reserved	Reserved	0x00
23	rw	I2C0_BERRF	I2C bus error flag for invalid Stop/Start state. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	rw	I2C0_ALOSF	I2C bus arbitration lost error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
21	rw	I2C0_NACKF	I2C Not Acknowledge received error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	I2C0_TOVRF	I2C data buffer transmit underrun error flag. Under the conditions, slave mode enables data buffer mode and clock stretching is disabled. When the data buffer is underrun, this bit is set and interrupt is generated if I2C0_ERR_IE is enabled. Also, the I2C0_ERRF is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	rw	I2C0_ROVRF	I2C data buffer receive overrun error flag. Under the conditions, slave mode enables data buffer mode and clock stretching is disabled. When the data buffer is overrun, this bit is set and interrupt is generated if I2C0_ERR_IE is enabled. Also, the I2C0_ERRF is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
18	rw	I2C0_TXRF	I2C transmit data register remained status. (set and clear by hardware) When occurs bus NACK error and I2C0_NACKF is asserted, this bit is used to check the data register content whether has remain data. The I2C master will STOP and firmware can calculate the corrected total transfer count by I2C0_ACNT. It is cleared in slave address matched state and updated after last byte NACK state. 0 = No data 1 = Remained data	0x00
17	rw	I2C0_STPSTRF	I2C Stop or Start detection flag. (set by hardware and clear	0x00

			by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	
16	rw	I2C0_TSCF	I2C shadow buffer transfer complete flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
15	r	I2C0_RWF	I2C read or write transfer direction status. It always update at slave address read/write state. 0 = Write 1 = Read	0x00
14	r	I2C0_MSTF	I2C master mode detection status. It set by Start command and clear by Stop state.	0x00
13	r	I2C0_SLAF	I2C slave mode detection status. It set by Slave address matched condition and clear by Start/Stop conditions.	0x00
12	rw	I2C0_SADRF	I2C slave mode slave address matched flag. This flag is also asserted for master mode if transmit mode slave address unmatched or received mode slave address asserted. When wakeup from STOP mode by detection matched slave address, user needs to clear this bit to disable the clock stretching and releases clock signal for external master. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
11	rw	I2C0_ERRCF	I2C master mode NACK error flag and state control bit. (set by hardware and clear by software writing 1 or hardware auto clear during START/STOP state) This bit is asserted if occurs NACK during slave-address cycle or data cycle of receive access. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10	rw	I2C0_CNTF	I2C buffer count I2C0_BUF_CNT empty status. (set by hardware and clear by software writing 1 or I2C0_BUF_CNT written) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
9	rw	I2C0_STOPF	I2C stop detection flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
8	rw	I2C0_RSTRF	I2C repeat start asserted flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
7	rw	I2C0_TXF	I2C Transmit data register empty. (set by hardware and clear by hardware or software writing 1) This bit is cleared when I2C_DAT is written or this flag set to 1 by software. The flag is set after I2C reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x01
6	rw	I2C0_RXF	I2C Receive data register not empty. (set by hardware and clear by hardware or software writing 1) This bit is cleared when I2C0_DAT is read or this flag set to 1 by software. But it does not be cleared when I2C0_DAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	rw	I2C0_WUPF	I2C wakeup from STOP mode flag. When hardware detect that the slave address is matched to I2C0_SADR (I2C0_SADR_EN=1) during STOP mode, this flag is	0x00

			asserted.(set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	
4	rw	I2C0_TMOUTF	I2C time-out detect flag. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	I2C0_ERRF	I2C error interrupt flag for invalid no ack, bus arbitration lost bus error or data overrun error. (set by hardware , clear by software setting 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	I2C0_BUFF	I2C buffer mode event flag. (set by hardware , clear by software setting 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	I2C0_EVENTF	I2C status event interrupt Flag. For Byte mode, this bit must be cleared and hardware can process to next state (set by hardware , clear by software setting 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	r	I2C0_BUSYF	I2C busy flag. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Busy (Event happened)	0x00

### 1.16.2. I2C0 interrupt enable register

<b>I2C0_INT</b>	<b>I2C0 interrupt enable register</b>
Offset Address :	0x04
Reset Value :	0x00000000

31	30	29	28	27	26	25	24

Bit	Attr	Bit Name	Description	Reset
31..27	-	Reserved	Reserved	0x00
26	rw	I2C0_PAA	I2C preload bit for Acknowledge enable bit.	0x00
25	rw	I2C0_PSTO	I2C preload bit for STOP enable bit.	0x00
24	rw	I2C0_PSTA	I2C preload bit for START enable bit.	0x00
23..19	-	Reserved	Reserved	0x00
18..16	r	I2C0_ACNT	I2C transmitted or received data actual byte count value. When transmitted or received data complete by last data transfer or error conditions, the actual transmitted or received data byte number is recorded in this register. The count value is not calculated and included the NACK error byte. For other conditions, this register value is no meaning. 0x0 = 0-byte 0x1 = 1-byte 0x2 = 2-byte 0x3 = 3-byte 0x4 = 4-byte	0x00
15..11	-	Reserved	Reserved	0x00
10..8	rw	I2C0_BUF_CNT	I2C transmitted or received data byte count threshold. When transmitted or received data arrives at the threshold and the interrupt enable bit of I2C0_BUFF_IE is enabled, the interrupt is generated. When writes this register, hardware will auto clear the I2C0_CNTF. 0x0 = Reserved 0x1 = 1-byte 0x2 = 2-byte 0x3 = 3-byte 0x4 = 4-byte	0x00
7	-	Reserved	Reserved	0x00
6	rw	I2C0_AA_LCK	I2C0_AA and I2C0_PAA bits write access protected control. When selects locked, disables the register bit write access. I2C0_AA and I2C0_PAA are written effectively only by written 1 to this bit simultaneously. 0 = Locked 1 = un-Locked	0x00
5	rw	I2C0_STO_LCK	I2C0_STO and I2C0_PSTO bits write access protected control. When selects locked, disables the register bit write access. I2C0_STO and I2C0_PSTO are written effectively only by written 1 to this bit simultaneously.	0x00

			0 = Locked 1 = un-Locked	
4	rw	<b>I2C0_STA_LCK</b>	I2C0_STA and I2C0_PSTA bits write access protected control. When selects locked, disables the register bit write access. I2C0_STA and I2C0_PSTA are written effectively only by written 1 to this bit simultaneously. 0 = Locked 1 = un-Locked	0x00
3	rw	<b>I2C0_CMD_TC</b>	I2C command preload enable control bit. When enables, it will write hold until I2C0_TCF set for I2C0_STA, I2C0_STO, I2C0_AA register bits. When disables, write these command bits that will directly execute the setting command. This bit is no effect if I2C0_BUF_EN=0. 0 = Disable 1 = Enable	0x00
2	rw	<b>I2C0_AA</b>	I2C assert Acknowledge enable bit. If the AA bit is set to '1', an ACK will be returned during the ACK clock pulse on the SCL line when: 1) The own slave address has been received. 2) A data byte has been received while I2C is in the master/receiver mode. 3) A data byte has been received while I2C is in the addressed slave/receiver mode. If the AA flag is reset to '0', a NACK will be returned during the ACK clock pulse on SCL when: 1) A data has been received while I2C is in the master/receiver mode. 2) A data byte has been received while I2C is in the addressed slave/receiver mode.	0x00
1	rw	<b>I2C0_STO</b>	I2C STOP enable bit. When the STO bit is set while I2C is in a master mode, a STOP condition is transmitted to the serial bus. When the STOP condition is detected on the bus, the I2C hardware clears the STO flag. In a slave mode, the STO flag may be set to recover from a bus error condition. In this case, no STOP condition is transmitted to the bus. However, the I2C hardware behaves as if a STOP condition has been received and switches to the defined not addressed slave receiver mode. The STO flag is automatically cleared by hardware. If the STA and STO bits are both set, then a STOP condition is transmitted to the bus if I2C is in a master mode (in a slave mode, I2C generates an internal STOP condition which is not transmitted), and then transmits a START condition.	0x00
0	rw	<b>I2C0_STA</b>	I2C START enable bit. When the STA bit is set to enter a master mode, the I2C hardware checks the status of the serial bus and generates a START condition if the bus is free. If the bus is not free, then I2C waits for a STOP condition and generates a START condition after a delay. If STA is set while I2C is already in a master mode and one or more bytes are transmitted or received, I2C transmits a repeated START condition. STA may be set at any time. STA may also be set when I2C is an addressed slave. When the STA bit is reset, no START condition or repeated START condition will be generated.	0x00

Bit	Attr	Bit Name	Description	Reset
31..25	-	Reserved	Reserved	0x00
24	-	Reserved	Reserved	0x00
23	rw	I2C1_BERRF	I2C bus error flag for invalid Stop/Start state. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	rw	I2C1_ALOSF	I2C bus arbitration lost error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
21	rw	I2C1_NACKF	I2C Not Acknowledge received error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	I2C1_TOVRF	I2C data buffer transmit underrun error flag. Under the conditions, slave mode enables data buffer mode and clock stretching is disabled. When the data buffer is underrun, this bit is set and interrupt is generated if I2C1_ERR_IE is enabled. Also, the I2C1_ERRF is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	rw	I2C1_ROVRF	I2C data buffer receive overrun error flag. Under the conditions, slave mode enables data buffer mode and clock stretching is disabled. When the data buffer is overrun, this bit is set and interrupt is generated if I2C1_ERR_IE is enabled. Also, the I2C1_ERRF is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
18	rw	I2C1_TXRF	I2C transmit data register remained status. (set and clear by hardware) When occurs bus NACK error and I2C1_NACKF is asserted, this bit is used to check the data register content whether has remain data. The I2C master will STOP and firmware can calculate the corrected total transfer count by I2C1_ACNT. It is cleared in slave address matched state and updated after last byte NACK state. 0 = No data 1 = Remained data	0x00
17	rw	I2C1_STPSTRF	I2C Stop or Start detection flag. (set by hardware and clear by software writing 1)	0x00

			0 = Normal (No event occurred) 1 = Happened (Event happened)	
16	rw	I2C1_TSCF	I2C shadow buffer transfer complete flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
15	r	I2C1_RWF	I2C read or write transfer direction status. It always update at slave address r/w state. 0 = Write 1 = Read	0x00
14	r	I2C1_MSTF	I2C master mode detection status. It set by Start command and clear by Stop state.	0x00
13	r	I2C1_SLAF	I2C slave mode detection status. It set by Slave address matched condition and clear by Start/Stop conditions.	0x00
12	rw	I2C1_SADRF	I2C slave mode slave address matched flag. This flag is also asserted for master mode if transmit mode slave address unmatched or received mode slave address asserted. When wakeup from STOP mode by detection matched slave address, user needs to clear this bit to disable the clock stretching and releases clock signal for external master. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
11	rw	I2C1_ERRCF	I2C master mode NACK error flag and state control bit. (set by hardware and clear by software writing 1 or hardware auto clear during START/STOP state) This bit is asserted if occurs NACK during slave-address cycle or data cycle of receive access. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10	rw	I2C1_CNTF	I2C buffer count I2C1_BUF_CNT empty status. (set by hardware and clear by software writing 1 or I2C1_BUF_CNT written) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
9	rw	I2C1_STOPF	I2C stop detection flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
8	rw	I2C1_RSTRF	I2C repeat start asserted flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
7	rw	I2C1_TXF	I2C Transmit data register empty. (set by hardware and clear by hardware or software writing 1) This bit is cleared when I2C1_DAT is written or this flag set to 1 by software. The flag is set after I2C reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x01
6	rw	I2C1_RXF	I2C Receive data register not empty. (set by hardware and clear by hardware or software writing 1) This bit is cleared when I2C1_DAT is read or this flag set to 1 by software. But it does not be cleared when I2C1_DAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	rw	I2C1_WUPF	I2C wakeup from STOP mode flag. When hardware detect that the slave address is matched to I2C1_SADR (I2C1_SADR_EN=1) during STOP mode, this flag is asserted.(set by hardware and clear by software writing 1)	0x00

			0 = Normal (No event occurred) 1 = Happened (Event happened)	
4	rw	<b>I2C1_TMOUTF</b>	I2C time-out detect flag. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	<b>I2C1_ERRF</b>	I2C error interrupt flag for invalid no ack, bus arbitration lost bus error or data overrun error. (set by hardware , clear by software setting 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00

Bit	Attr	Bit Name	Description	Reset
31..27	-	Reserved	Reserved	0x00
26	rw	I2C1_PAA	I2C preload bit for Acknowledge enable bit.	0x00
25	rw	I2C1_PSTO	I2C preload bit for STOP enable bit.	0x00
24	rw	I2C1_PSTA	I2C preload bit for START enable bit.	0x00
23..19	-	Reserved	Reserved	0x00
18..16	r	I2C1_ACNT	I2C transmitted or received data actual byte count value. When transmitted or received data complete by last data transfer or error conditions, the actual transmitted or received data byte number is recorded in this register. The count value is not calculated and included the NACK error byte. For other conditions, this register value is no meaning. 0x0 = 0-byte 0x1 = 1-byte 0x2 = 2-byte 0x3 = 3-byte 0x4 = 4-byte	0x00
15..11	-	Reserved	Reserved	0x00
10..8	rw	I2C1_BUF_CNT	I2C transmitted or received data byte count threshold. When transmitted or received data arrives at the threshold and the interrupt enable bit of I2C1_BUFF_IE is enabled, the interrupt is generated. When writes this register, hardware will auto clear the I2C1_CNTF. 0x0 = Reserved 0x1 = 1-byte 0x2 = 2-byte 0x3 = 3-byte 0x4 = 4-byte	0x00
7	-	Reserved	Reserved	0x00
6	rw	I2C1_AA_LCK	I2C1_AA and I2C1_PAA bits write access protected control. When selects locked, disables the register bit write access. I2C0_AA and I2C0_PAA are written effectively only by written 1 to this bit simultaneously. 0 = Locked 1 = un-Locked	0x00
5	rw	I2C1_STO_LCK	I2C1_STO and I2C1_PSTO bits write access protected control. When selects locked, disables the register bit write access. I2C1_STO and I2C1_PSTO are written effectively only by written 1 to this bit simultaneously. 0 = Locked 1 = un-Locked	0x00
4	rw	I2C1_STA_LCK	I2C1_STA and I2C1_PSTA bits write access protected control. When selects locked, disables the register bit write access. I2C1_STA and I2C1_PSTA are written effectively only by written 1 to this bit simultaneously.	0x00

			0 = Locked 1 = un-Locked	
3	rw	I2C1_CMD_TC	I2C command preload enable control bit. When enables, it will write hold until I2C1_TCF set for I2C1_STA, I2C1_STO, I2C1_AA register bits. When disables, write these command bits that will directly execute the setting command. This bit is no effect if I2C0_BUF_EN=0. 0 = Disable 1 = Enable	0x00
2	rw	I2C1_AA	I2C assert Acknowledge enable bit. If the AA flag is set to '1', an ACK will be returned during the ACK clock pulse on the SCL line when: 1) The own slave address has been received. 2) A data byte has been received while I2C is in the master/receiver mode. 3) A data byte has been received while I2C is in the addressed slave/receiver mode. If the AA flag is reset to '0', a NACK will be returned during the ACK clock pulse on SCL when: 1) A data has been received while I2C is in the master/receiver mode. 2) A data byte has been received while I2C is in the addressed slave/receiver mode.	0x00
1	rw	I2C1_STO	I2C STOP enable bit. When the STO bit is set while I2C is in a master mode, a STOP condition is transmitted to the serial bus. When the STOP condition is detected on the bus, the I2C hardware clears the STO flag. In a slave mode, the STO flag may be set to recover from a bus error condition. In this case, no STOP condition is transmitted to the bus. However, the I2C hardware behaves as if a STOP condition has been received and switches to the defined not addressed slave receiver mode. The STO flag is automatically cleared by hardware. If the STA and STO bits are both set, then a STOP condition is transmitted to the bus if I2C is in a master mode (in a slave mode, I2C generates an internal STOP condition which is not transmitted), and then transmits a START condition.	0x00
0	rw	I2C1_STA	I2C START enable bit. When the STA bit is set to enter a master mode, the I2C hardware checks the status of the serial bus and generates a START condition if the bus is free. If the bus is not free, then I2C waits for a STOP condition and generates a START condition after a delay. If STA is set while I2C is already in a master mode and one or more bytes are transmitted or received, I2C transmits a repeated START condition. STA may be set at any time. STA may also be set when I2C is an addressed slave. When the STA bit is reset, no START condition or repeated START condition will be generated.	0x00

## 1.18. URT0 Control Registers

<b>URT0 Control</b>	<b>(URT0) UART Control Module-0</b>
Base Address :	<b>0x52000000</b>

## 1.18.1. URT0 status register 1

URT0_STA	URT0 status register 1		
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved	URT0_CALTMOF	URT0_BKTMOF	URT0_IDTMOF	URT0_RXTMOF	Reserved	URT0_TUDRF	URT0_TXEF
23	22	21	20	19	18	17	16
URT0_ROVRF	URT0_NCEF	URT0_FEF	URT0_PEF	URT0_NSSF	URT0_CTSF	URT0_IDLF	URT0_BKF
15	14	13	12	11	10	9	8
URT0_CALOVF	URT0_CALUDF	URT0_CALCF	URT0_TMOF	URT0_BRTF	URT0_SADRF	Reserved	Reserved
7	6	5	4	3	2	1	0
URT0_TXF	URT0_RXF	URT0_RXDF	URT0_LSF	URT0_ERRF	URT0_TCF	URT0_UGF	URT0_RHF

Bit	Attr	Bit Name	Description	Reset
31	-	Reserved	Reserved	0x00
30	rw	URT0_CALTMOF	UART auto baud-rate calibration sync field receive time-out time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
29	rw	URT0_BKTMOF	UART break receive time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
28	rw	URT0_IDTMOF	UART idle state time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
27	rw	URT0_RXTMOF	UART receive time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
26	-	Reserved	Reserved	0x00
25	rw	URT0_TUDRF	UART SPI slave mode transmit underrun flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
24	rw	URT0_TXEF	UART TX error detect flag. (set by hardware and clear by software writing 1) Refer to the register descriptions of URTx_TXE_MDS for detail. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
23	rw	URT0_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	rw	URT0_NCEF	UART receive noised character error flag. (set by hardware	0x00

			and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	
21	rw	URT0_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT0_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	rw	URT0_NSSF	UART SPI slave mode NSS signal inactive detect interrupt flag. (set by hardware and clear by software writing 1) When the module is configured to SPI slave mode, this flag is asserted if the input NSS signal has changed from active to inactive. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
18	rw	URT0_CTSF	UART CTS change detect interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
17	rw	URT0_IDLF	UART idle line detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
16	rw	URT0_BKF	UART break condition detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
15	r	URT0_CALOVF	UART auto baud-rate calibration overflow status flag. This flag is asserted when the baud-rate calibration counter is changed overflow during baud-rate calibration (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
14	r	URT0_CALUDF	UART auto baud-rate calibration underflow status flag. This flag is asserted when the baud-rate calibration counter is changed to zero during baud-rate calibration (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
13	rw	URT0_CALCF	UART auto baud-rate calibration complete flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
12	rw	URT0_TMOF	UART timeout timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
11	rw	URT0_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10	rw	URT0_SADRF	UART slave address matched flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
9	-	Reserved	Reserved	0x00
8	-	Reserved	Reserved	0x00
7	rw	URT0_TXF	UART transmit data register empty. (set by hardware and clear	0x00

			by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	
6	rw	URT0_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	r	URT0_RXDF	UART received data byte number is different from previous received data byte number for URTx_RDAT register. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	URT0_LSF	UART line statue flag for break condition, idle line, CTS detect. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	URT0_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT0_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT0_UGF	UART general event flag. It indicates each of URTx_SADRF , URTx_BRTF , URTx_TMOF or URTx_CALCFC flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	rw	URT0_RHF	UART receive hold flag. It indicates one of hardware hold event is happened when this flag is set. In the condition, the shift buffer is held and do not load data to shadow buffer until this bit is cleared. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00

### 1.18.2. UART interrupt enable register

URT0_INT	UART interrupt enable register

Bit	Attr	Bit Name	Description	Reset
31..28	rw	URT0_CALTMO_TH	UART calibration timeout detect threshold value for TMO counter value comparison. When the TMO counter over the threshold, the calibration timeout is happened. The timeout threshold equals (register value)*BASE. When URT0_BR_MDS sets 'Separated', the BASE value is 0x10 and value 0 indicates counter overflow value 0xFF. When URT0_BR_MDS sets 'Combined', the BASE value is 0x100 and value 0 indicates counter overflow value 0xFFFF. When calibration has finished, the TMO counter value will be copied to update the baud-rate generator BRO timer. If calibration timeout is happened, the BRO timer will keep the old baud-rate setting.	0x00
27..24	rw	URT0_BKTMO_TH	UART receive Break timeout detect threshold value by using receive bit time. The timeout threshold is starting after URTx_BKF bit asserting when hardware detect a Break character. Value 0 indicates 1 bit time.	0x00
23..16	rw	URT0_RXTMO_TH	UART RX data buffer timeout detect threshold value by using receive bit time. The timeout threshold is starting after STOP bit of the last character. The timeout threshold equal (register value+1)*8 (receive bit time) and value 0 indicates 8 bits time.	0x00
15	rw	URT0_TMO_LCK	UART timeout timer timeout signal initial state control. When locked, disables the register bit write access. Hardware auto clear after register write access. 0 = Locked 1 = Un-Locked	0x00
14	rw	URT0_TMO_STA	UART timeout timer timeout signal initial state. The bit is written effectively only by written 1 to URTx_TMO_LCK simultaneously. 0 = 0 (Output 0) 1 = 1 (Output 1)	0x00
13..11	-	Reserved	Reserved	0x00
10..8	rw	URT0_TMO_CKS	UART timeout timer clock source select. When URTx_TMO_MDS selects 'UART' mode, this register must select CK_URTxBIT(UART) as TMO timer clock for normal	0x00

			operation. When selects 'Noise' and sets URTx_TMO_EN=1, the number of received noise bit is able to read from URTx_TMO_CNT. 0x0 = UART (CK_URTx_BIT clock) 0x1 = Input (CK_UART clock input) 0x2 = Noise (Noise bit receive event) 0x3 = Reserved	
7	rw	URT0_CALTMO_EN	UART Calibration timeout detection enable bit. When enables and URTx_CAL_AUTO=1 if Break condition has detected, chip will trigger timer-out timer to start counting. After the Calibration timeout detection and the corrected auto-sync-field has not received, UART will assert Calibration timeout flag and do not update the BR counter reload value of calibration result. 0 = Disable 1 = Enable	0x00
6	rw	URT0_BKTMO_EN	UART Break timeout detection enable bit. When enables and Break condition has detected, chip will trigger time-out timer to start counting. After Break timeout detection, UART will assert Break timeout flag. 0 = Disable 1 = Enable	0x00
5	rw	URT0_RXTMO_EN	UART RX timeout enable bit for shadow buffer data loading into URTx_RDAT. When timeout happened and shadow buffer storing data >=1 byte, chip will load shadow buffer into URTx_RDAT register even though it is not over the receive threshold URTx_RX_TH. User can read data to speed process. 0 = Disable 1 = Enable	0x00
4	rw	URT0_IDTMO_EN	UART Idle timeout detection enable bit. When enables and Idle timeout has detected, UART will assert idle timeout flag. The time is starting after STOP bit of the last character. (for SmartCard maximum guard-time) 0 = Disable 1 = Enable	0x00
3..2	rw	URT0_TMO_MDS	UART timeout timer mode select. When selects general timer, the timer auto reload function is enabled and URTx_IDTMO_TH is used as the auto reload register. 0x0 = UART : UART timeout timer 0x1 = General : general using timer	0x00
1	rw	URT0_TMO_RST	UART timeout timer force reset enable. (set by software and clear by hardware) 0 = Disable 1 = Enable	0x00
0	rw	URT0_TMO_EN	UART timeout timer enable. 0 = Disable 1 = Enable	0x00

## 1.19. URT1 Control Registers

<b>URT1 Control</b>	<b>(URT1) UART Control Module-1</b>
Base Address :	<b>0x52010000</b>

## 1.19.1. URT1 status register 1

URT1_STA		URT1 status register 1	
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved	URT1_CALTMOF	URT1_BKTMOF	URT1_IDTMOF	URT1_RXTMOF	Reserved	URT1_TUDRF	URT1_TXEF
23	22	21	20	19	18	17	16
URT1_ROVRF	URT1_NCEF	URT1_FEF	URT1_PEF	URT1_NSSF	URT1_CTSF	URT1_IDLF	URT1_BKF
15	14	13	12	11	10	9	8
URT1_CALOVF	URT1_CALUDF	URT1_CALCF	URT1_TMOF	URT1_BRTF	URT1_SADRF	Reserved	Reserved
7	6	5	4	3	2	1	0
URT1_TXF	URT1_RXF	URT1_RXDF	URT1_LSF	URT1_ERRF	URT1_TCF	URT1_UGF	URT1_RHF

Bit	Attr	Bit Name	Description	Reset
31	-	Reserved	Reserved	0x00
30	rw	URT1_CALTMOF	UART auto baud-rate calibration sync field receive time-out time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
29	rw	URT1_BKTMOF	UART break receive time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
28	rw	URT1_IDTMOF	UART idle state time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
27	rw	URT1_RXTMOF	UART receive time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
26	-	Reserved	Reserved	0x00
25	rw	URT1_TUDRF	UART SPI slave mode transmit underrun flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
24	rw	URT1_TXEF	UART TX error detect flag. (set by hardware and clear by software writing 1) Refer to the register descriptions of URTx_TXE_MDS for detail. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
23	rw	URT1_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	rw	URT1_NCEF	UART receive noised character error flag. (set by hardware	0x00

			and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	
21	rw	URT1_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT1_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	rw	URT1_NSSF	UART SPI slave mode NSS signal inactive detect interrupt flag. (set by hardware and clear by software writing 1) When the module is configured to SPI slave mode, this flag is asserted if the input NSS signal has changed from active to inactive. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
18	rw	URT1_CTSF	UART CTS change detect interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
17	rw	URT1_IDLF	UART idle line detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
16	rw	URT1_BKF	UART break condition detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
15	r	URT1_CALOVF	UART auto baud-rate calibration overflow status flag. This flag is asserted when the baud-rate calibration counter is changed overflow during baud-rate calibration (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
14	r	URT1_CALUDF	UART auto baud-rate calibration underflow status flag. This flag is asserted when the baud-rate calibration counter is changed to zero during baud-rate calibration (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
13	rw	URT1_CALCF	UART auto baud-rate calibration complete flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
12	rw	URT1_TMOF	UART timeout timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
11	rw	URT1_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10	rw	URT1_SADRF	UART slave address matched flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
9	-	Reserved	Reserved	0x00
8	-	Reserved	Reserved	0x00
7	rw	URT1_TXF	UART transmit data register empty. (set by hardware and clear	0x00

			by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	
6	rw	URT1_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	r	URT1_RXDF	UART received data byte number is different from previous received data byte number for URTx_RDAT register. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	URT1_LSF	UART line statue flag for break condition, idle line, CTS detect. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	URT1_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT1_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT1_UGF	UART general event flag. It indicates each of URTx_SADRF , URTx_BRTF , URTx_TMOF or URTx_CALC_F flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	rw	URT1_RHF	UART receive hold flag. It indicates one of hardware hold event is happened when this flag is set. In the condition, the shift buffer is held and do not load data to shadow buffer until this bit is cleared. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00

### 1.19.2. URT1 interrupt enable register

URT1_INT	URT1 interrupt enable register

7	6	5	4	3	2	1	0
URT1_CALTMO_EN	URT1_BKTMO_EN	URT1_RXTMO_EN	URT1_IDTMO_EN	URT1_TMO_MDS[1:0]		URT1_TMO_RST	URT1_TMO_EN

Bit	Attr	Bit Name	Description	Reset
31..28	rw	URT1_CALTMO_TH	UART calibration timeout detect threshold value for TMO counter value comparison. When the TMO counter over the threshold, the calibration timeout is happened. The timeout threshold equals (register value)*BASE. When URT0_BR_MDS sets 'Separated', the BASE value is 0x10 and value 0 indicates counter overflow value 0xFF. When URT0_BR_MDS sets 'Combined', the BASE value is 0x100 and value 0 indicates counter overflow value 0xFFFF. When calibration has finished, the TMO counter value will be copied to update the baud-rate generator BRO timer. If calibration timeout is happened, the BRO timer will keep the old baud-rate setting.	0x00
27..24	rw	URT1_BKTMO_TH	UART receive Break timeout detect threshold value by using receive bit time. The timeout threshold is starting after URTx_BKF bit asserting when hardware detect a Break character. Value 0 indicates 1 bit time.	0x00
23..16	rw	URT1_RXTMO_TH	UART RX data buffer timeout detect threshold value by using receive bit time. The timeout threshold is starting after STOP bit of the last character. The timeout threshold equal (register value+1)*8 (receive bit time) and value 0 indicates 8 bits time.	0x00
15	rw	URT1_TMO_LCK	UART timeout timer timeout signal initial state control. When locked, disables the register bit write access. Hardware auto clear after register write access. 0 = Locked 1 = Un-Locked	0x00
14	rw	URT1_TMO_STA	UART timeout timer timeout signal initial state. The bit is written effectively only by written 1 to URTx_TMO_LCK simultaneously. 0 = 0 (Output 0) 1 = 1 (Output 1)	0x00
13..11	-	Reserved	Reserved	0x00
10..8	rw	URT1_TMO_CKS	UART timeout timer clock source select. When URTx_TMO_MDS selects 'UART' mode, this register must select CK_URTxBIT(UART) as TMO timer clock for normal operation. When selects 'Noise' and sets URTx_TMO_EN=1, the number of received noise bit is able to read from URTx_TMO_CNT. 0x0 = UART (CK_URTxBIT clock)	0x00

			0x1 = Input (CK_UART clock input) 0x2 = Noise (Noise bit receive event) 0x3 = Reserved	
7	rw	URT1_CALTMO_EN	UART Calibration timeout detection enable bit. When enables and URTx_CAL_AUTO=1 if Break condition has detected, chip will trigger timer-out timer to start counting. After the Calibration timeout detection and the corrected auto-sync-field has not received, UART will assert Calibration timeout flag and do not update the BR counter reload value of calibration result. 0 = Disable 1 = Enable	0x00
6	rw	URT1_BKTMO_EN	UART Break timeout detection enable bit. When enables and Break condition has detected, chip will trigger time-out timer to start counting. After Break timeout detection, UART will assert Break timeout flag. 0 = Disable 1 = Enable	0x00
5	rw	URT1_RXTMO_EN	UART RX timeout enable bit for shadow buffer data loading into URTx_RDAT. When timeout happened and shadow buffer storing data >=1 byte, chip will load shadow buffer into URTx_RDAT register even though it is not over the receive threshold URTx_RX_TH. User can read data to speed process. 0 = Disable 1 = Enable	0x00
4	rw	URT1_IDTMO_EN	UART Idle timeout detection enable bit. When enables and Idle timeout has detected, UART will assert idle timeout flag. The time is starting after STOP bit of the last character. (for SmartCard maximum guard-time) 0 = Disable 1 = Enable	0x00
3..2	rw	URT1_TMO_MDS	UART timeout timer mode select. When selects general timer, the timer auto reload function is enabled and URTx_IDTMO_TH is used as the auto reload register. 0x0 = UART (UART timeout timer) 0x1 = General (general timer)	0x00
1	rw	URT1_TMO_RST	UART timeout timer force reset enable. (set by software and clear by hardware) 0 = Disable 1 = Enable	0x00
0	rw	URT1_TMO_EN	UART timeout timer enable. 0 = Disable 1 = Enable	0x00

### 1.19.18. URT1 timeout control register 2

## 1.20. URT2 Control Registers

<b>URT2 Control</b>	<b>(URT2) UART Control Module-2</b>
Base Address :	<b>0x52020000</b>

## 1.20.1. URT2 status register 1

URT2_STA		URT2 status register 1	
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved	URT2_CALTMOF	URT2_BKTMOF	URT2_IDTMOF	URT2_RXTMOF	Reserved	URT2_TUDRF	URT2_TXEF
23	22	21	20	19	18	17	16
URT2_ROVRF	URT2_NCEF	URT2_FEF	URT2_PEF	URT2_NSSF	URT2_CTSF	URT2_IDLF	URT2_BKF
15	14	13	12	11	10	9	8
URT2_CALOVF	URT2_CALUDF	URT2_CALCF	URT2_TMOF	URT2_BRTF	URT2_SADRF	Reserved	Reserved
7	6	5	4	3	2	1	0
URT2_TXF	URT2_RXF	URT2_RXDF	URT2_LSF	URT2_ERRF	URT2_TCF	URT2_UGF	URT2_RHF

Bit	Attr	Bit Name	Description	Reset
31	-	Reserved	Reserved	0x00
30	rw	URT2_CALTMOF	UART auto baud-rate calibration sync field receive time-out time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
29	rw	URT2_BKTMOF	UART break receive time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
28	rw	URT2_IDTMOF	UART idle state time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
27	rw	URT2_RXTMOF	UART receive time out flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
26	-	Reserved	Reserved	0x00
25	rw	URT2_TUDRF	UART SPI slave mode transmit underrun flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
24	rw	URT2_TXEF	UART TX error detect flag. (set by hardware and clear by software writing 1) Refer to the register descriptions of URTx_TXE_MDS for detail. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
23	rw	URT2_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	rw	URT2_NCEF	UART receive noised character error flag. (set by hardware	0x00

			and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	
21	rw	URT2_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT2_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	rw	URT2_NSSF	UART SPI slave mode NSS signal inactive detect interrupt flag. (set by hardware and clear by software writing 1) When the module is configured to SPI slave mode, this flag is asserted if the input NSS signal has changed from active to inactive. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
18	rw	URT2_CTSF	UART CTS change detect interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
17	rw	URT2_IDLF	UART idle line detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
16	rw	URT2_BKF	UART break condition detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
15	r	URT2_CALOVF	UART auto baud-rate calibration overflow status flag. This flag is asserted when the baud-rate calibration counter is changed overflow during baud-rate calibration (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
14	r	URT2_CALUDF	UART auto baud-rate calibration underflow status flag. This flag is asserted when the baud-rate calibration counter is changed to zero during baud-rate calibration (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
13	rw	URT2_CALCFC	UART auto baud-rate calibration complete flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
12	rw	URT2_TMOF	UART timeout timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
11	rw	URT2_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10	rw	URT2_SADRF	UART slave address matched flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
9	-	Reserved	Reserved	0x00
8	-	Reserved	Reserved	0x00
7	rw	URT2_TXF	UART transmit data register empty. (set by hardware and clear	0x00

			by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	
6	rw	URT2_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	r	URT2_RXDF	UART received data byte number is different from previous received data byte number for URTx_RDAT register. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	URT2_LSF	UART line statue flag for break condition, idle line, CTS detect. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	URT2_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT2_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT2_UGF	UART general event flag. It indicates each of URTx_SADRF , URTx_BRTF , URTx_TMOF or URTx_CALCFC flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	rw	URT2_RHF	UART receive hold flag. It indicates one of hardware hold event is happened when this flag is set. In the condition, the shift buffer is held and do not load data to shadow buffer until this bit is cleared. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00

### 1.20.2. URT2 interrupt enable register

URT2_INT	URT2 interrupt enable register

7	6	5	4	3	2	1	0
URT2_GSA_EN	URT2_MDS[2:0]	URT2_MDS[2:0]	URT2_DAT_LINE	URT2_HDX_EN	URT2_OS_MDS	URT2_OS_MDS	URT2_EN

Bit	Attr	Bit Name	Description	Reset
31	rw	URT2_DMA_TXEN	Direct memory access enable to transmit. When enables, hardware can receive the data from DMA and transmit to output. This bit is enabled to write if URTx_TX_EN=0. 0 = Disable 1 = Enable	0x00
30	rw	URT2_DMA_RXEN	Direct memory access enable to receive. When enables, hardware can receive the data from input and send to DMA. This bit is enabled to write if URTx_RX_EN=0. 0 = Disable 1 = Enable	0x00
29	rw	URT2_DDTX_EN	Hardware force to disable DMA TX function enable bit when detects a break condition. When enables, hardware will disable the URTx_DMA_TXEN bit if hardware detects a break condition. Also, the URTx_DMA_RXEN bit is disabled in this condition. When disables, hardware will keep to do DMA TX function if hardware detects a break condition. 0 = Disable 1 = Enable	0x00
28	-	Reserved	Reserved	0x00
27	-	Reserved	Reserved	0x00
26..25	-	Reserved	Reserved	0x00
24	-	Reserved	Reserved	0x00
23	rw	URT2_LBM_EN	UART loop back mode enable bit. When enables, the received input is taken from transmitted output to replace from input pin(RX ->TX ,CTS -> RTS). 0 = Disable 1 = Enable	0x00
22	rw	URT2_NCHAR_DIS	UART receiving noised character disable bit. When disables, the received noised character is skipped and does not assert the URTx_RXF interrupt. Also the noised character will copy to URTx_RCAP data register. When enables, the noised character is accepted for receiving. 0 = Enable (Accept noised character) 1 = Disable (Skip noised character)	0x00
21	rw	URT2_NCHAR_HE	UART receiving hold enable bit if receives a noised character. This bit is no effect when URTx_NCHAR_DIS=0. When enables and URTx_NCHAR_DIS=1, the received data will be hold from shift buffer to shadow buffer and the URTx_RHF will be active after received noised character. Until the URTx_RHF is cleared, chip will release the hold function. 0 = Disable 1 = Enable	0x00
20	rw	URT2_IDL_MDS	UART idle line detect management mode select. When selects 'Load' and detects idle line, chip will load shadow buffer into URTx_RDAT register even though it is not over the receive threshold URTx_RX_TH if shadow buffer is not empty.	0x00

			0 = No (No operation) 1 = Load (Force to load shadow buffer)	
19..18	-	<b>Reserved</b>	Reserved	0x00
17..16	rw	<b>URT2_RX_TH</b>	UART data buffer high threshold for received access. This register will set to '0' (1byte) and is no effect for register written if URTx_DMA_RXEN is enabled. 0x0 = 1byte (default) 0x1 = 2byte 0x2 = 3byte 0x3 = 4byte	0x00

Bit	Attr	Bit Name	Description	Reset
31..28	rw	URT2_CALTMO_TH	UART calibration timeout detect threshold value for TMO counter value comparison. When the TMO counter over the threshold, the calibration timeout is happened. The timeout threshold equals (register value)*BASE. When URT0_BR_MDS sets 'Separated', the BASE value is 0x10 and value 0 indicates counter overflow value 0xFF. When URT0_BR_MDS sets 'Combined', the BASE value is 0x100 and value 0 indicates counter overflow value 0xFFFF. When calibration has finished, the TMO counter value will be copied to update the baud-rate generator BRO timer. If calibration timeout is happened, the BRO timer will keep the old baud-rate setting.	0x00
27..24	rw	URT2_BKTMO_TH	UART receive Break timeout detect threshold value by using receive bit time. The timeout threshold is starting after URTx_BKF bit asserting when hardware detect a Break character. Value 0 indicates 1 bit time.	0x00
23..16	rw	URT2_RXTMO_TH	UART RX data buffer timeout detect threshold value by using receive bit time. The timeout threshold is starting after STOP bit of the last character. The timeout threshold equal (register value+1)*8 (receive bit time) and value 0 indicates 8 bits time.	0x00
15	rw	URT2_TMO_LCK	UART timeout timer timeout signal initial state control. When locked, disables the register bit write access. Hardware auto clear after register write access. 0 = Locked 1 = Un-Locked	0x00
14	rw	URT2_TMO_STA	UART timeout timer timeout signal initial state. The bit is written effectively only by written 1 to URTx_TMO_LCK simultaneously. 0 = 0 (Output 0) 1 = 1 (Output 1)	0x00
13..11	-	Reserved	Reserved	0x00
10..8	rw	URT2_TMO_CKS	UART timeout timer clock source select. When URTx_TMO_MDS selects 'UART' mode, this register must select CK_URTxBIT(UART) as TMO timer clock for normal operation. When selects 'Noise' and sets URTx_TMO_EN=1, the number of received noise bit is able to read from URTx_TMO_CNT. 0x0 = UART (CK_URTxBIT clock)	0x00

			0x1 = Input (CK_UART clock input) 0x2 = Noise (Noise bit receive event) 0x3 = Reserved	
7	rw	URT2_CALTMO_EN	UART Calibration timeout detection enable bit. When enables and URTx_CAL_AUTO=1 if Break condition has detected, chip will trigger timer-out timer to start counting. After the Calibration timeout detection and the corrected auto-sync-field has not received, UART will assert Calibration timeout flag and do not update the BR counter reload value of calibration result. 0 = Disable 1 = Enable	0x00
6	rw	URT2_BKTMO_EN	UART Break timeout detection enable bit. When enables and Break condition has detected, chip will trigger time-out timer to start counting. After Break timeout detection, UART will assert Break timeout flag. 0 = Disable 1 = Enable	0x00
5	rw	URT2_RXTMO_EN	UART RX timeout enable bit for shadow buffer data loading into URTx_RDAT. When timeout happened and shadow buffer storing data >=1 byte, chip will load shadow buffer into URTx_RDAT register even though it is not over the receive threshold URTx_RX_TH. User can read data to speed process. 0 = Disable 1 = Enable	0x00
4	rw	URT2_IDTMO_EN	UART Idle timeout detection enable bit. When enables and Idle timeout has detected, UART will assert idle timeout flag. The time is starting after STOP bit of the last character. (for SmartCard maximum guard-time) 0 = Disable 1 = Enable	0x00
3..2	rw	URT2_TMO_MDS	UART timeout timer mode select. When selects general timer, the timer auto reload function is enabled and URTx_IDTMO_TH is used as the auto reload register. 0x0 = UART (UART timeout timer) 0x1 = General (general timer)	0x00
1	rw	URT2_TMO_RST	UART timeout timer force reset enable. (set by software and clear by hardware) 0 = Disable 1 = Enable	0x00
0	rw	URT2_TMO_EN	UART timeout timer enable. 0 = Disable 1 = Enable	0x00

### 1.20.18. URT2 timeout control register 2

URT2_TMOUT2		URT2 timeout control register 2					
Offset Address :		0x44		Reset Value :		0x00000000	
31	30	29	28	27	26	25	24

## 1.21. URT4 Control Registers

<b>URT4 Control</b>	<b>(URT4) UART Control Module-4</b>
Base Address :	<b>0x52040000</b>

## 1.21.1. URT4 status register 1

URT4_STA	URT4 status register 1		
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
23	22	21	20	19	18	17	16
URT4_ROVRF	Reserved	URT4_FEF	URT4_PEF	Reserved	Reserved	Reserved	Reserved
15	14	13	12	11	10	9	8
Reserved	Reserved	Reserved	Reserved	URT4_BRTF	Reserved	Reserved	Reserved
7	6	5	4	3	2	1	0
URT4_TXF	URT4_RXF	Reserved	Reserved	URT4_ERRF	URT4_TCF	URT4_UGF	Reserved

Bit	Attr	Bit Name	Description	Reset
31	-	Reserved	Reserved	0x00
30	-	Reserved	Reserved	0x00
29	-	Reserved	Reserved	0x00
28	-	Reserved	Reserved	0x00
27	-	Reserved	Reserved	0x00
26..25	-	Reserved	Reserved	0x00
24	-	Reserved	Reserved	0x00
23	rw	URT4_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	-	Reserved	Reserved	0x00
21	rw	URT4_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT4_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	-	Reserved	Reserved	0x00
18	-	Reserved	Reserved	0x00
17	-	Reserved	Reserved	0x00
16	-	Reserved	Reserved	0x00
15	-	Reserved	Reserved	0x00
14	-	Reserved	Reserved	0x00
13	-	Reserved	Reserved	0x00
12	-	Reserved	Reserved	0x00
11	rw	URT4_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00

10	-	Reserved	Reserved	0x00
9	-	Reserved	Reserved	0x00
8	-	Reserved	Reserved	0x00
7	rw	URT4_TXF	UART transmit data register empty. (set by hardware and clear by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	rw	URT4_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	-	Reserved	Reserved	0x00
4	-	Reserved	Reserved	0x00
3	rw	URT4_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT4_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT4_UGF	UART general event flag. It indicates each of URTx_SADRF, URTx_BRTF, URTx_TMOF or URTx_CALCF flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	-	Reserved	Reserved	0x00

### 1.21.2. URT4 interrupt enable register

## 1.22. URT5 Control Registers

<b>URT5 Control</b>	<b>(URT5) UART Control Module-5</b>
Base Address :	<b>0x52050000</b>

## 1.22.1. URT5 status register 1

URT5_STA		URT5 status register 1	
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
URT5_ROVRF	Reserved	URT5_FEF	URT5_PEF	Reserved			
15	14	13	12	11	10	9	8
Reserved				URT5_BRTF	Reserved		
7	6	5	4	3	2	1	0
URT5_TXF	URT5_RXF	Reserved		URT5_ERRF	URT5_TCF	URT5_UGF	Reserved

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23	rw	URT5_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	-	Reserved	Reserved	0x00
21	rw	URT5_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT5_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19..16	-	Reserved	Reserved	0x00
15..12	-	Reserved	Reserved	0x00
11	rw	URT5_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10..8	-	Reserved	Reserved	0x00
7	rw	URT5_TXF	UART transmit data register empty. (set by hardware and clear by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	rw	URT5_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to	0x00

			the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	
5..4	-	Reserved	Reserved	0x00
3	rw	URT5_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT5_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT5_UGF	UART general event flag. It indicates each of URTx_SADRF , URTx_BRTF , URTx_TMOF or URTx_CALCF flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	-	Reserved	Reserved	0x00

### 1.22.2. URT5 interrupt enable register

## 1.23. URT6 Control Registers

<b>URT6 Control</b>	<b>(URT6) UART Control Module-6</b>
Base Address :	<b>0x52060000</b>

## 1.23.1. URT6 status register 1

URT6_STA		URT6 status register 1	
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
URT6_ROVRF	Reserved	URT6_FEF	URT6_PEF	Reserved			
15	14	13	12	11	10	9	8
Reserved				URT6_BRTF	Reserved		
7	6	5	4	3	2	1	0
URT6_TXF	URT6_RXF	Reserved		URT6_ERRF	URT6_TCF	URT6_UGF	Reserved

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23	rw	URT6_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	-	Reserved	Reserved	0x00
21	rw	URT6_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT6_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19..16	-	Reserved	Reserved	0x00
15..12	-	Reserved	Reserved	0x00
11	rw	URT6_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10..8	-	Reserved	Reserved	0x00
7	rw	URT6_TXF	UART transmit data register empty. (set by hardware and clear by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	rw	URT6_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to	0x00

			the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	
5..4	-	Reserved	Reserved	0x00
3	rw	URT6_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT6_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT6_UGF	UART general event flag. It indicates each of URTx_SADRF, URTx_BRTF, URTx_TMOF or URTx_CALCF flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	-	Reserved	Reserved	0x00

### 1.23.2. URT6 interrupt enable register

URT6_INT	URT6 interrupt enable register
Offset Address :	0x04
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

URT6_TX_IE	URT6_RX_IE	Reserved		URT6_ERR_IE	URT6_TC_IE	URT6_UG_IE	URT6 IEA

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23	rw	URT6_ROVR_IE	UART receive overrun error interrupt enable. Refer to the register descriptions of URTx_ROVRF for the detail. 0 = Disable 1 = Enable	0x00
22	-	Reserved	Reserved	0x00
21	rw	URT6_FE_IE	UART frame error interrupt enable. 0 = Disable 1 = Enable	0x00
20	rw	URT6_PE_IE	UART parity error interrupt enable. 0 = Disable 1 = Enable	0x00
19..16	-	Reserved	Reserved	0x00
15..12	-	Reserved	Reserved	0x00
11	rw	URT6_BRT_IE	UART baud-rate generator timer timeout interrupt enable. 0 = Disable 1 = Enable	0x00
10..8	-	Reserved	Reserved	0x00

7	rw	<b>URT6_TX_IE</b>	UART transmit data register empty interrupt enable. Refer to the register descriptions of URTx_TXF for the detail. 0 = Disable 1 = Enable	0x00
6	rw	<b>URT6_RX_IE</b>	UART receive data register not empty interrupt enable. Refer to the register descriptions of URTx_RXF for the detail. 0 = Disable 1 = Enable	0x00
5..4	-	<b>Reserved</b>	Reserved	0x00
3	rw	<b>URT6_ERR_IE</b>	UART error interrupt enable for parity error, frame error, overrun error, receive time out and noise error. 0 = Disable 1 = Enable	0x00
2	rw	<b>URT6_TC_IE</b>	UART transmission complete interrupt enable. (set by hardware and clear by hardware or software writing 1) 0 = Disable 1 = Enable	0x00
1	rw	<b>URT6_UG_IE</b>	UART general event interrupt enable for URTx_SADRF , URTx_TF , URTx_RCNTF or URTx_TCNTF events. 0 = Disable 1 = Enable	0x00
0	rw	<b>URT6_IEA</b>	UART interrupt all enable. When disables, the UART global all interrupt event are disabled. When enables, the related event interrupt enable bit is to enable or disable the interrupt. 0 = Disable 1 = Enable	0x00

### 1.23.3. URT6 clock source register

<b>URT6_CLK</b>	<b>URT6 clock source register</b>

## 1.24. URT7 Control Registers

<b>URT7 Control</b>	<b>(URT7) UART Control Module-7</b>
Base Address :	<b>0x52070000</b>

## 1.24.1. URT7 status register 1

URT7_STA	URT7 status register 1		
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
URT7_ROVRF	Reserved	URT7_FEF	URT7_PEF	Reserved			
15	14	13	12	11	10	9	8
Reserved				URT7_BRTF	Reserved		
7	6	5	4	3	2	1	0
URT7_TXF	URT7_RXF	Reserved		URT7_ERRF	URT7_TCF	URT7_UGF	Reserved

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23	rw	URT7_ROVRF	UART receive overrun error flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. This flag is indicated for following two conditions. (1) When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. (2) When Parity error, Frame error, Break detect or Slave-Address detect, has happened and caused RX shadow buffer input holding. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
22	-	Reserved	Reserved	0x00
21	rw	URT7_FEF	UART frame error flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	URT7_PEF	UART parity error flag. (set by hardware and clear by software writing 1) When multi-processor mode, the parity value is including of address bit. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19..16	-	Reserved	Reserved	0x00
15..12	-	Reserved	Reserved	0x00
11	rw	URT7_BRTF	UART baud-rate generator timer timeout flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10..8	-	Reserved	Reserved	0x00
7	rw	URT7_TXF	UART transmit data register empty. (set by hardware and clear by hardware or software writing 1) When transmitted shadow buffer is empty and the data register URTx_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when URTx_TDAT is written or this flag set to 1 by software. The flag is set after UART reset or Idle state. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	rw	URT7_RXF	UART receive data register not empty. (set by hardware and clear by hardware or software writing 1) When received shadow buffer level URTx_RX_LVL is greater than or equal to	0x00

			the shadow buffer threshold URTx_RX_TH setting, this flag is set and the shadow buffer content copy to data register URTx_RDAT. This bit is cleared when URTx_RDAT is read or this flag set to 1 by software. But it does not be cleared when URTx_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	
5..4	-	Reserved	Reserved	0x00
3	rw	URT7_ERRF	UART error interrupt flag for parity error, frame error, overrun error, receive time out and noise error. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	URT7_TCF	UART transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	URT7_UGF	UART general event flag. It indicates each of URTx_SADRF, URTx_BRTF, URTx_TMOF or URTx_CALCF flag is asserted when this flag is set. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	-	Reserved	Reserved	0x00

### 1.24.2. URT7 interrupt enable register

URT7_INT	URT7 interrupt enable register
Offset Address :	0x04
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
URT7_ROVR_IE	Reserved	URT7_FE_IE	URT7_PE_IE	Reserved			
15	14	13	12	11	10	9	8

7	6	5	4	3	2	1	0
URT7_TX_IE	URT7_RX_IE	Reserved		URT7_ERR_IE	URT7_TC_IE	URT7_UG_IE	URT7 IEA

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23	rw	URT7_ROVR_IE	UART receive overrun error interrupt enable. Refer to the register descriptions of URTx_ROVRF for the detail. 0 = Disable 1 = Enable	0x00
22	-	Reserved	Reserved	0x00
21	rw	URT7_FE_IE	UART frame error interrupt enable. 0 = Disable 1 = Enable	0x00
20	rw	URT7_PE_IE	UART parity error interrupt enable. 0 = Disable 1 = Enable	0x00
19..16	-	Reserved	Reserved	0x00
15..12	-	Reserved	Reserved	0x00
11	rw	URT7_BRT_IE	UART baud-rate generator timer timeout interrupt enable. 0 = Disable 1 = Enable	0x00
10..8	-	Reserved	Reserved	0x00

7	rw	<b>URT7_TX_IE</b>	UART transmit data register empty interrupt enable. Refer to the register descriptions of URTx_TXF for the detail. 0 = Disable 1 = Enable	0x00
6	rw	<b>URT7_RX_IE</b>	UART receive data register not empty interrupt enable. Refer to the register descriptions of URTx_RXF for the detail. 0 = Disable 1 = Enable	0x00
5..4	-	<b>Reserved</b>	Reserved	0x00
3	rw	<b>URT7_ERR_IE</b>	UART error interrupt enable for parity error, frame error, overrun error, receive time out and noise error. 0 = Disable 1 = Enable	0x00
2	rw	<b>URT7_TC_IE</b>	UART transmission complete interrupt enable. (set by hardware and clear by hardware or software writing 1) 0 = Disable 1 = Enable	0x00
1	rw	<b>URT7_UG_IE</b>	UART general event interrupt enable for URTx_SADRF , URTx_TF , URTx_RCNTF or URTx_TCNTF events. 0 = Disable 1 = Enable	0x00
0	rw	<b>URT7_IEA</b>	UART interrupt all enable. When disables, the UART global all interrupt event are disabled. When enables, the related event interrupt enable bit is to enable or disable the interrupt. 0 = Disable 1 = Enable	0x00

### 1.24.3. URT7 clock source register

<b>URT7_CLK</b>	<b>URT7 clock source register</b>
Offset Address :	<b>0x08</b>

15	14	13	12	11	10	9	8
Reserved		Reserved	Reserved	SPI0_TUDRF	SPI0_ROVRF	SPI0_WEF	SPI0_MODF
7	6	5	4	3	2	1	0
SPI0_TXF	SPI0_RXF	SPI0_RXDF	SPI0_TCF	SPI0_IDLF	Reserved		SPI0_BUSYF

Bit	Attr	Bit Name	Description	Reset
31	r	SPI0_IDL_STA	SPI idle state detect status for Slave with NSS mode. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x01
30..27	-	Reserved	Reserved	0x00
26..24	rw	SPI0_RNUM	SPI received data byte number when data shadow buffer last transfer to SPI0_RDAT register. Firmware can write an initial value for received byte number comparison. See more information in SPI0_RXDF status bit. Value 0~4 is valid only. 0x0 = 0 (0-byte) 0x1 = 1 (1-byte) 0x2 = 2 (2-byte) 0x3 = 3 (3-byte) 0x4 = 4 (4-byte)	0x00
23	-	Reserved	Reserved	0x00
22..20	r	SPI0_TX_LVL	SPI data buffer transmission remained level indications. 0x0 = 0 (0-byte,empty) 0x1 = 1 (1-byte) 0x2 = 2 (2-byte) 0x3 = 3 (3-byte) 0x4 = 4 (4-byte)	0x00
19	-	Reserved	Reserved	0x00
18..16	r	SPI0_RX_LVL	SPI data buffer received level indications. 0x0 = 0 (0-byte,empty) 0x1 = 1 (1-byte) 0x2 = 2 (2-byte) 0x3 = 3 (3-byte) 0x4 = 4 (4-byte)	0x00
15..14	-	Reserved	Reserved	0x00
13	-	Reserved	Reserved	0x00
12	-	Reserved	Reserved	0x00
11	rw	SPI0_TUDRF	SPI slave mode transmit underrun flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
10	rw	SPI0_ROVRF	SPI receive overrun flag. (set by hardware and clear by software writing 1) When receive overrun, hardware will stop to receive next data into data shadow buffer until this flag is cleared. When RX shadow buffer is arrived over the RX threshold and the data register has not read out. If shift buffer is filled of next data, this flag is asserted. 0 = Normal (No event occurred)	0x00

			1 = Happened (Event happened)	
9	rw	<b>SPIO_WEF</b>	SPI slave mode write error flag. It will assert an error when master stop read by setting high on NSS signal before a complete data transaction. The bit size of a data transaction is defined in SPIO_DSIZE. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
8	rw	<b>SPIO_MODF</b>	SPI mode detect fault flag. When master mode SPIO_NSSI_EN enables, this flag will be set if NSS input signal is active. Also it will force SPIO_BDIR_OE to set 'Disable' and SPIO_TX_DIS to set 'Enable'. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
7	rw	<b>SPIO_TXF</b>	SPI transmit data register empty flag (set by hardware and clear by hardware or software writing 1). When transmitted shadow buffer is empty and the data register SPIO_TDAT will copy to the shadow buffer, this flag is set. This bit is cleared when SPIO_TDAT is written or this flag set to 1 by software. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	rw	<b>SPIO_RXF</b>	SPI receive data register not empty. (set by hardware and clear by hardware or software writing 1). When received shadow buffer level SPIO_RX_LVL is greater than or equal to the data buffer threshold SPIO_RX_TH setting, this flag is set and the shadow buffer content copy to data register SPIO_RDAT. This bit is cleared when SPIO_RDAT is read or this flag set to 1 by software. But it does not be cleared when SPIO_RDAT is read by SWD debugging. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	r	<b>SPIO_RXDF</b>	SPI received data byte number is different from previous received data byte number for SPIO_RDAT register. (set and clear by hardware) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	<b>SPIO_TCF</b>	SPI transmission complete flag. When both shadow buffer and data register are empty and shift buffer shift out complete, then set this flag. (set by hardware and clear by hardware or software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	<b>SPIO_IDLF</b>	SPI slave mode NSS idle detect flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2..1	-	<b>Reserved</b>	Reserved	0x00
0	r	<b>SPIO_BUSYF</b>	SPI data transfer busy flag.	0x00

Bit	Attr	Bit Name	Description	Reset
31	rw	<b>SPI0_DMA_TXEN</b>	Direct memory access enable to transmit. When enables, hardware can receive the data from DMA and transmit to output. 0 = Disable 1 = Enable	0x00
30	rw	<b>SPI0_DMA_RXEN</b>	Direct memory access enable to receive. When enables, hardware can receive the data from input and send to DMA. 0 = Disable 1 = Enable	0x00
29	rw	<b>SPI0_DMA_MDS</b>	Direct memory access enable to do pre-catch one data for receive mode. 0 = Disable 1 = Enable	0x00
28	-	<b>Reserved</b>	Reserved	0x00
27	-	<b>Reserved</b>	Reserved	0x00
26	rw	<b>SPI0_ASYNC_EN</b>	SPI standard slave mode clock input asynchronous function enable. When enables, the SPI shift buffer clock is directly used the SPI clock (SPI0_CLK) input. When disables, the SPI clock (SPI0_CLK) input is synchronized by internal clock. 0 = Disable 1 = Enable	0x00
25	rw	<b>SPI0_HS_EN</b>	SPI slave mode high speed function enable. When this bit is enabled and SPI is slave synchronous mode (SPI0_ASYNC_EN=0), the SPI clock frequency can operate up	0x00

			to 1/3 APB clock frequency. 0 = Disable 1 = Enable	
24	rw	<b>SPIO_ADPX_EN</b>	SPI slave mode auto full duplex data mode enable. This bit is no effect when SPIO_NSSI_EN is disabled. When this bit is enabled and NSS input is changed from inactive to active, the SPIO_DAT_LINE will be auto forced to 0 and change to full duplex standard SPI mode. 0 = Disable 1 = Enable	0x00
23..22	rw	<b>SPIO_DOUT_IDL</b>	SPI idle state data output value. When SPI standard master mode SPIO_DOUT_MDS is enabled, the SPIO_MOSI output is with driving during idle state and the output level is set by this bit. 0x0 = LBIT (Last data bit) 0x1 = Reserved 0x2 = 0 (Output 0) 0x3 = 1 (Output 1)	0x00
21	rw	<b>SPIO_DOUT_MDS</b>	SPI master standard mode idle state data output mode select. When disables and data transfers during idle state, the SPIO_MOSI will output with tristate for master mode. When enables and data transfers during idle state, the MOSI will output with driving for master mode. 0 = Disable : Output with tristate 1 = Enable : Output with driving	0x00
20	rw	<b>SPIO_NSSI_SWEN</b>	SPI NSS input signal use software control bit enable. When enables, the SPI NSS input is coming from the SPIO_NSSI_SWI register setting. When disables, the SPI NSS input is coming from external SPIO_NSS or SPIO_NSSI pin. 0 = Disable 1 = Enable	0x00
19	rw	<b>SPIO_LBM_EN</b>	Loop back mode enable bit. When enables, the received input is taken from transmitted output to replace from input pin(SPIO_MISO or SPIO_MOSI). 0 = Disable 1 = Enable	0x00
18	rw	<b>SPIO_RX_CTL</b>	SPI master mode data receive sampling edge control bit. When selects 'Normal', the SPI data sampling on leading edge or trailing edge of SPI clock is set in SPIO_CPHA register. When selects 'Next', the SPI data sampling at the next half-clock edge of the selected clock edge which is set in SPIO_CPHA register. 0 = Normal : SPIO_CPHA selected clock edge 1 = Next : Next clock edge of SPIO_CPHA selected edge	0x00
17	-	<b>Reserved</b>	Reserved	0x00
16	rw	<b>SPIO_TX_CTL</b>	SPI slave mode data transmit timing control bit. This bit is no effect if SPIO_ASYNC_EN=0. When selects 'Normal', the SPI data outputted at the next edge of the selected clock edge which is set in SPIO_CPHA register. When selects 'Previous', the SPI data outputted at the previous half-clock edge of the selected clock edge of 'Normal' which is set in SPIO_CPHA register. 0 = Normal : Normal edge of standard SPI timing 1 = Previous : Previous clock edge of standard SPI timing	0x00
15	rw	<b>SPIO_MODF_SEL</b>	SPI function select when master mode fault detect. 0 = SPI disable 1 = Switch to slave	0x00
14	rw	<b>SPIO_NSS_PEN</b>	SPI single master mode NSS pulse enable. When enables, NSS will be automatically active between two sequential frame data transferred and the pulse width is set by SPIO_NSS_IDT.	0x00

			0 = Disable 1 = Enable	
13	rw	<b>SPI0_NSSI_INV</b>	SPI NSS input signal inverse enable. 0 = Disable 1 = Enable	0x00
12	rw	<b>SPI0_NSSO_INV</b>	SPI NSS output signal inverse enable. The hardware NSS output default is low active level. 0 = Disable 1 = Enable	0x00
11	rw	<b>SPI0_NSS_SWEN</b>	SPI NSS signal output use software control bit enable. When enables, the NSS output is coming from SPI0_NSS_SWO register setting. 0 = Disable 1 = Enable	0x00
10	rw	<b>SPI0_NSSI_SEL</b>	SPI pin select for NSS input signal. 0 = NSS (SPI0_NSS pin) 1 = NSSI (SPI0_NSSI pin)	0x00
9	rw	<b>SPI0_NSSI_EN</b>	SPI_NSS signal input function enable. The input signal is also using for master mode change/fault detection. 0 = Disable 1 = Enable	0x00
8	rw	<b>SPI0_NSSO_EN</b>	SPI_NSS signal output function enable. 0 = Disable 1 = Enable	0x00
7	rw	<b>SPI0_IO_SWP</b>	SPI I/O SPI_MOSI, SPI_MISO signals swap enable. 0 = Disable 1 = Enable	0x00
6	rw	<b>SPI0_IO_SWP2</b>	SPI IO SPI0_D0~3 and SPI0_D4~7 signals swap enable. 0 = Disable 1 = Enable	0x00
5..4	rw	<b>SPI0_MDS</b>	SPI operation mode select. 0x0 = Slave 0x1 = Master 0x2 = Reserved 0x3 = Reserved	0x00
3	rw	<b>SPI0_LSB_EN</b>	SPI data order Lsb first enable. When disables , the Msb bit will be the first bit. 0 = Disable 1 = Enable	0x00
2	rw	<b>SPI0_CPHA</b>	SPI clock phase select. It is used to select the data sampling on leading edge or trailing edge of SPI clock. 0 = Leading edge 1 = Trailing edge	0x00
1	rw	<b>SPI0_CPOL</b>	SPI clock polarity select. It is used to select the SPI clock level in idle state. 0 = Low 1 = High	0x00
0	rw	<b>SPI0_EN</b>	SPI function enable bit. 0 = Disable 1 = Enable	0x00

			APB_MF0_MUX. 0x0 = OUT1 : Internal using 0x1 = TCLK : CK_CAN0_TQ 0x2 = SMP : Internal using 0x3 = RXS : Internal using	
19..18	-	Reserved	Reserved	0x00
17..16	rw	CAN0_S0_SEL	CAN0_S0 output signal select. This signal is one of the source signal of MF_S0. It can be using by setting in APB_MF0_MUX. 0x0 = STB : CAN0_STB signal (active high) 0x1 = BCLK : Internal using 0x2 = TXINV : Inversed TX signal 0x3 = CKO : Internal using	0x00
15	rw	CAN0_SRR_EN	CAN self reception request enable bit. When this bit is enabled, a message is to be transmitted and received simultaneously. 0 = Disable 1 = Enable	0x00
14	rw	CAN0_TXE_MDS	CAN message transmission mode select. When selects 'Resend', the chip will automatically retransmit the message until the message has been successfully transmitted. When selects 'Once', the message will be transmitted only once. 0 = Resend 1 = Once	0x00
13	rw	CAN0_EDF_MDS	CAN receive edge detect filter mode select after FDF bit is detected. When selects 'Normal', the edge detection is hit if detects input high-to-low condition. When selects 'Sample', the edge detection is hit if detects input high-to-low and samples two successive '0' conditions. 0 = Normal 1 = Sample	0x00
12	rw	CAN0_FDT_MDS	CAN receive FDF bit mode select. For CAN FD the FDF bit is at the same location of r0 is for standard frame or r1 for extended frame. When selects 'Normal' for CAN 2.0, the data frame is normal reception whatever the received r0/r1 bit value. When selects 'Skip' for CAN FD tolerant, the data frame is skipped if r0 is '1' for standard frame or r1 is '1' for extended frame. CAN FD tolerant is not able to receive or transmit FD frame but not disturbing them. 0 = Normal 1 = Skip	0x00
11	rw	CAN0_TX_INV	CAN0_TX output signal inverse enable. 0 = Disable 1 = Enable	0x00
10	rw	CAN0_RX_INV	CAN0_RX input signal inverse enable. 0 = Disable 1 = Enable	0x00
9	-	Reserved	Reserved	0x00
8	rw	CAN0_IO_SWP	CAN_RX/CAN_TX swap enable bit. 0 = Disable 1 = Enable	0x00
7	rw	CAN0_OS_MDS	CAN RX data oversampling mode select. When selects 'Three', the bus will be sampled three times. When selects 'One', the bus will be sampled once. 0 = One 1 = Three	0x00
6..4	rw	CAN0_TST_MDS	CAN test mode select. When selects 'LBM', the received input is taken from transmitted output to replace from input pin(RX ->TX). When selects 'SIL', the module does not send an acknowledge to the CAN bus, even when a message is received successfully. When disables, the error counters are	0x00

			stopped at the current value. When selects 'LBS', the received input is taken from transmitted output. The internal CAN input and output are opened to external CAN bus. 0x0 = Disable 0x1 = LBM : Loop back mode 0x2 = SIL : Silent mode 0x3 = LBS : Loop back combined with silent mode 0x4 = Reserved 0x5 = Reserved 0x6 = Reserved 0x7 = Reserved	
3	rw	<b>CAN0_WUP_MDS</b>	CAN wakeup mode select. When selects 'Soft', the chip is left CAN low power mode on software request by cleared CAN0_LP_EN bit. When selects 'Auto', the chip will be left CAN low power mode automatically by RX signal active detection. 0 = Soft 1 = Auto	0x00
2	rw	<b>CAN0_LP_EN</b>	CAN Low Power mode enable bit. When this bit enables and CANx_INIT_EN is disabled, the module enters its sleep mode provided no CAN interrupt is pending and there is no bus activity. If CANx_INIT_EN is enabled, this bit is invalid to set 'Enable'. When the module has entered low power mode, there are only CANx_EN, CANx_INIT_EN and CANx_LP_EN bits which can be access. (If there is bus activity or an interrupt is pending, the wake-up procedure is executed.) 0 = Disable 1 = Enable	0x00
1	rw	<b>CAN0_INIT_EN</b>	CAN Initial mode enable bit. When enables, any message currently being transmitted or received is aborted and CAN Initial mode is entered. When disables, the module returns to Normal mode. 0 = Disable 1 = Enable	0x01
0	rw	<b>CAN0_EN</b>	CAN function enable bit. 0 = Disable 1 = Enable	0x00

### 1.26.6. CAN0 control register 1

## 1.27. Timer00 Control Registers

<b>Timer00 Control</b>	<b>(TM00) Timer Control Module-00</b>
Base Address :	<b>0x55000000</b>

## 1.27.1. TM00 Timer status register

TM00_STA	TM00 Timer status register		
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
TM00_TUF2	Reserved	TM00_TOF2	TM00_TOF	TM00_EXF	Reserved		Reserved

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..8	-	Reserved	Reserved	0x00
7	rw	TM00_TUF2	2nd Timer underflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	-	Reserved	Reserved	0x00
5	rw	TM00_TOF2	2nd Timer overflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	TM00_TOF	Main Timer overflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	TM00_EXF	Timer external trigger flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2..1	-	Reserved	Reserved	0x00
0	-	Reserved	Reserved	0x00

## 1.27.2. TM00 Timer interrupt enable register

TM00_INT	TM00 Timer interrupt enable register		
Offset Address :	0x04	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		TM00_TIE2	TM00_TIE	TM00_EXIE	Reserved		TM00_IEA

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..8	-	Reserved	Reserved	0x00
7..6	-	Reserved	Reserved	0x00

5	rw	<b>TM00_TIE2</b>	2nd Timer overflow/underflow interrupt enable. 0 = Disable 1 = Enable	0x00
4	rw	<b>TM00_TIE</b>	Timer overflow/underflow interrupt enable. 0 = Disable 1 = Enable	0x00
3	rw	<b>TM00_EXIE</b>	Timer external trigger interrupt enable. 0 = Disable 1 = Enable	0x00
2..1	-	<b>Reserved</b>	Reserved	0x00
0	rw	<b>TM00_IEA</b>	Timer interrupt all enable. When disables, the timer global all interrupt event are disabled. When enables, the related event interrupt enable bit is to enable or disable the interrupt. 0 = Disable 1 = Enable	0x00

### 1.27.3. TM00 Timer clock source register

<b>TM00_CLK</b>	<b>TM00 Timer clock source register</b>
Offset Address :	<b>0x08</b>
Reset Value :	<b>0x00000000</b>

31	30	29	28	27	26	25	24

## 1.32. Timer26 Control Registers

<b>Timer26 Control</b>	<b>(TM26) Timer Control Module-26</b>
Base Address :	<b>0x56060000</b>

## 1.32.1. TM26 Timer status register

TM26_STA	TM26 Timer status register		
Offset Address :	0x00	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		TM26_IDCF	TM26_RTUF	TM26_QPEF	TM26_IDXF	Reserved	TM26_DIRCF
15	14	13	12	11	10	9	8
Reserved		TM26_CF1B	TM26_CF0B	Reserved		TM26_CF1A	TM26_CF0A
7	6	5	4	3	2	1	0
TM26_TUF2	TM26_TUF	TM26_TOF2	TM26_TOF	TM26_EXF	Reserved		TM26_DIRF

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23..22	-	Reserved	Reserved	0x00
21	rw	TM26_IDCF	Input duty capture complete flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
20	rw	TM26_RTUF	Repetition timer underflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
19	rw	TM26_QPEF	Main Timer QEI phase state transition error detect flag. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
18	rw	TM26_IDXF	Main Timer QEI external index signal input active detect and internal timer reset flag. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
17	-	Reserved	Reserved	0x00
16	rw	TM26_DIRCF	Main Timer up/down counting direction change flag. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
15..14	-	Reserved	Reserved	0x00
13	rw	TM26_CF1B	Timer IC1 falling edge flag/OC1 event sub flag. (set by hardware and clear by software writing 1) Refer to the register descriptions of TM26_CF0B. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
12	rw	TM26_CF0B	Timer IC0 falling edge flag/OC0 event sub flag. (set by hardware and clear by software writing 1) [Capture Mode]: Input capture event sub flag for single edge mode or input capture falling edge event flag for dual edge mode. [16-bit Compare/PWM Mode]: When center-alignment PWM mode, this bit is used as down counting PWM compare flag. It is no using for other 16-bit comparator mode. [8-bit Compare/PWM Mode]: (1) When compare-L is PWM and center-alignment mode, this bit is used as down counting PWM compare-L flag. (2) Others, this bit is used as compare-H event flag. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00

11..10	-	Reserved	Reserved	0x00
9	rw	TM26_CF1A	Timer IC1 rising edge flag/OC1 event main flag. (set by hardware and clear by software writing 1) Refer to the register descriptions of TM26_CF0A. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
8	rw	TM26_CF0A	Timer IC0 rising edge flag/OC0 event main flag. (set by hardware and clear by software writing 1) [Capture Mode]: Input capture event main flag for single edge mode or input capture rising edge event flag for dual edge mode. [16-bit Compare/PWM Mode]: Output compare event flag for 16-bit comparator mode. When center-alignment PWM mode, this bit is used as up counting PWM compare flag. [8-bit Compare/PWM Mode]: Output compare-L event flag. When compare-L is PWM and center-alignment mode, this bit is used as up counting PWM compare-L flag. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
7	rw	TM26_TUF2	2nd Timer underflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
6	rw	TM26_TUF	Main Timer underflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
5	rw	TM26_TOF2	2nd Timer overflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	TM26_TOF	Main Timer overflow flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	TM26_EXF	Timer external trigger flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2..1	-	Reserved	Reserved	0x00
0	r	TM26_DIRF	Main Timer up/down counting flag. 0 = Up counting 1 = Down counting	0x00

### 1.32.2. TM26 Timer interrupt enable register

TM26_INT		TM26 Timer interrupt enable register					
Offset Address :		0x04		Reset Value :		0x00000000	
31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		TM26_IDC_IE	TM26_RTU_IE	TM26_QPE_IE	TM26_IDX_IE	Reserved	TM26_DIRC_IE
15	14	13	12	11	10	9	8
Reserved						TM26_CC1_IE	TM26_CC0_IE
7	6	5	4	3	2	1	0
Reserved		TM26_TIE2	TM26_TIE	TM26_EXIE	Reserved		TM26_IEA
Bit	Attr	Bit Name		Description		Reset	
31..24	-	Reserved		Reserved		0x00	

23..22	-	Reserved	Reserved	0x00
21	rw	TM26_IDC_IE	Input duty capture complete interrupt enable. 0 = Disable 1 = Enable	0x00
20	rw	TM26_RTU_IE	Repetition timer underflow interrupt enable. 0 = Disable 1 = Enable	0x00
19	rw	TM26_QPE_IE	Main Timer QEI phase state transition error detect interrupt enable. 0 = Disable 1 = Enable	0x00
18	rw	TM26_IDX_IE	Main Timer QEI external index signal input active detect interrupt enable. 0 = Disable 1 = Enable	0x00
17	-	Reserved	Reserved	0x00
16	rw	TM26_DIRC_IE	Main Timer up/down counting direction change interrupt enable. 0 = Disable 1 = Enable	0x00
15..10	-	Reserved	Reserved	0x00
9	rw	TM26_CC1_IE	Timer IC1/OC1 interrupt enable. 0 = Disable 1 = Enable	0x00
8	rw	TM26_CC0_IE	Timer IC0/OC0 interrupt enable. 0 = Disable 1 = Enable	0x00
7..6	-	Reserved	Reserved	0x00
5	rw	TM26_TIE2	2nd Timer overflow/underflow interrupt enable. 0 = Disable 1 = Enable	0x00
4	rw	TM26_TIE	Timer overflow/underflow interrupt enable. 0 = Disable 1 = Enable	0x00
3	rw	TM26_EXIE	Timer external trigger interrupt enable. 0 = Disable 1 = Enable	0x00
2..1	-	Reserved	Reserved	0x00
0	rw	TM26_IEA	Timer interrupt all enable. When disables, the timer global all interrupt event are disabled. When enables, the related event interrupt enable bit is to enable or disable the interrupt. 0 = Disable 1 = Enable	0x00

### 1.32.3. TM26 Timer clock source register

TM26_CLK		TM26 Timer clock source register					
Offset Address :		0x08		Reset Value :		0x00000000	
31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		TM26_RC_CKS[1:0]		Reserved			
15	14	13	12	11	10	9	8
Reserved		TM26_CK1_DIV[1:0]		Reserved		TM26_CK1_SEL[1:0]	
7	6	5	4	3	2	1	0
TM26_CKS2_SEL	TM26_CKS_SEL	TM26_CKE_SEL[1:0]		Reserved			

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00

23..22	-	Reserved	Reserved	0x00
21..20	rw	TM26_RC_CKS	Repetition Timer/Counter clock source select. 0x0 = MAIN : clock input from Main timer overflow/underflow 0x1 = CKO : clock input from CK_CKOM 0x2 = TC : clock input from CK_TC	0x00
19..16	-	Reserved	Reserved	0x00
15..14	-	Reserved	Reserved	0x00
13..12	rw	TM26_CKI_DIV	Timer internal clock CK_TM26_INT input divider. 0x0 = DIV1 : divided by 1 0x1 = DIV2 : divided by 2 0x2 = DIV4 : divided by 4 0x3 = DIV8 : divided by 8	0x00
11..10	-	Reserved	Reserved	0x00
9..8	rw	TM26_CKI_SEL	Timer input clock CK_TM26 source select. 0x0 = PROC : CK_TM26_PR process clock from CSC 0x1 = Reserved 0x2 = CK_LS 0x3 = Reserved	0x00
7	rw	TM26_CKS2_SEL	Counter/Timer CK_TC2 clock source select. 0 = CK_INT 1 = CK_EXT	0x00
6	rw	TM26_CKS_SEL	Counter/Timer CK_TC clock source select. 0 = CK_INT 1 = CK_EXT	0x00
5..4	rw	TM26_CKE_SEL	Timer internal clock CK_EXT source select. 0x0 = ETR (CK_ETR) 0x1 = ITR (CK_ITR) 0x2 = IN0 (TM26_IN0) 0x3 = IN1 (TM26_IN1)	0x00
3..0	-	Reserved	Reserved	0x00

#### 1.32.4. TM26 Timer trigger control register

<b>TM26_TRG</b>	<b>TM26 Timer trigger control register</b>
Offset Address :	0x0C
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
TM26_GT2_SW	TM26_GT_SW	TM26_RST2_SW	TM26_RST_SW	Reserved		TM26_TRGO_INV	TM26_TRGO_SW
23	22	21	20	19	18	17	16
TM26_UEV_SEL[1:0]		TM26_IDX_MDS[1:0]		TM26_IDX_EN	TM26_QEI_MDS[2:0]		
15	14	13	12	11	10	9	8
TM26_TRGO_MDS[3:0]				Reserved	TM26_ITR_MUX[2:0]		
7	6	5	4	3	2	1	0
TM26_TRG_MUX[1:0]		TM26_TRGI2_MDS[2:0]			TM26_TRGI_MDS[2:0]		

Bit	Attr	Bit Name	Description	Reset
31	rw	TM26_GT2_SW	2nd Timer clock gating software enable bit. 0 = Disable 1 = Enable	0x00
30	rw	TM26_GT_SW	Timer clock gating software enable bit. 0 = Disable 1 = Enable	0x00
29	rw	TM26_RST2_SW	2nd Timer reset software enable bit. 0 = Disable 1 = Enable	0x00
28	rw	TM26_RST_SW	Timer reset software enable bit. 0 = Disable 1 = Enable	0x00
27..26	-	Reserved	Reserved	0x00
25	rw	TM26_TRGO_INV	Timer TRGO output inverse enable bit.	0x00

			0 = Disable 1 = Enable	
24	rw	<b>TM26_TRGO_SW</b>	Timer TRGO software control data bit. 0 = 0 (Output 0) 1 = 1 (Output 1)	0x00
23..22	rw	<b>TM26_UEV_SEL</b>	Timer UEV output select bits for TM26_TRGO. When TM26_TRGO_MDS selects UEV as output signal, this bit uses to select output pulse function from Main timer overflow and/or underflow. These bits are no effect when TM26_TRGO_MDS does not select UEV as output. 0x0 = All : output all UEV pulses 0x1 = TOF : output timer overflow pulses 0x2 = UDF : output timer underflow pulses 0x3 = Reserved	0x00
21..20	rw	<b>TM26_IDX_MDS</b>	Main Timer QEI external index signal input reset timer transition state select. 0x0 = 1T2 : State change between 1 and 2 0x1 = 2T3 : State change between 2 and 3 0x2 = 3T4 : State change between 3 and 4 0x3 = 4T1 : State change between 4 and 1	0x00
19	rw	<b>TM26_IDX_EN</b>	Main Timer QEI external index signal input enable. When enables and the index signal will input from TM26_ETR, the timer will reset during up counting or reload the auto-reload value during down counting if detect the index signal active pulse. 0 = Disable 1 = Enable	0x00
18..16	rw	<b>TM26_QEI_MDS</b>	Main Timer quadrature encoder interface(QEI) or external input timer up/down control mode select. 0x0 = No operation (up/down control by TM26_DIR) 0x1 = IN0POS : TM26_IN0 positive (high level up count, low level down count) 0x2 = IN0NEG : TM26_IN0 negative (low level up count, high level down count) 0x3 = IN0TRG : TM26_IN0 trigger (edge depending on TM26_IN1 level) 0x4 = IN1TRG : TM26_IN1 trigger (edge depending on TM26_IN0 level) 0x5 = BOTH : Both TM26_IN0 and TM26_IN1 edge	0x00
15..12	rw	<b>TM26_TRGO_MDS</b>	Timer trigger output mode select 0x0 = RST : TM26_RST (Main Timer Reset) 0x1 = EN : TM26_EN (Main Timer Enable) 0x2 = UEV : TM26_UEV (Main Timer Update event) 0x3 = TOF : TM26_TOF (Main Timer overflow) 0x4 = TUF : TM26_TUF (Main Timer underflow) 0x5 = EN2 : TM26_EN2 (Timer-2 Enable) 0x6 = TOF2 : TM26_TOF2 (Timer-2 overflow) 0x7 = DIR : TM26_DIR (Main Timer direction event) 0x8 = UEV2 : TM26_UEV2 (Timer-2 Update event) 0x9 = SW : TM26_TRGO_SW (software control bit) 0xA = OS0 : TM26_OS0 (channel-0 output state signal) 0xB = OS1 : TM26_OS1 (channel-1 output state signal) 0xC = Reserved 0xD = Reserved 0xE = TRGI : TM26_TRGI (internal TRGI signal) 0xF = POE : TM26_POE (Output enable register preload signal)	0x00
11	-	<b>Reserved</b>	Reserved	0x00
10..8	rw	<b>TM26_ITR_MUX</b>	Timer internal trigger source select. See the [Timer Internal Trigger and Channel Input Signals Table] for more information. 0x0 = ITR0 (TM26_ITR0)	0x00

			0x1 = ITR1 (TM26_ITR1) 0x2 = ITR2 (TM26_ITR2) 0x3 = ITR3 (TM26_ITR3) 0x4 = ITR4 (TM26_ITR4) 0x5 = ITR5 (TM26_ITR5) 0x6 = ITR6 (TM26_ITR6) 0x7 = ITR7 (TM26_ITR7)	
7..6	rw	<b>TM26_TRG_MUX</b>	Timer trigger source TRGI select. 0x0 = ETR (CK_ETR) 0x1 = ITR (CK_ITR) 0x2 = IN0 (TM26_IN0) 0x3 = IN1 (TM26_IN1)	0x00
5..3	rw	<b>TM26_TRGI2_MDS</b>	2nd Timer trigger input mode select 0x0 = No operation 0x1 = Trigger-R (TRGI rising) 0x2 = Reset-R (TRGI rising) 0x3 = Gate-H (TRGI high) 0x4 = Reset (TRGI dual edge) 0x5 = Trigger-F (TRGI falling) 0x6 = Reset-F (TRGI falling) 0x7 = Gate-L (TRGI low)	0x00
2..0	rw	<b>TM26_TRGI_MDS</b>	Timer trigger input mode select 0x0 = No operation 0x1 = Trigger-R (TRGI rising) 0x2 = Reset-R (TRGI rising) 0x3 = Gate-H (TRGI high) 0x4 = Reset (TRGI dual edge) 0x5 = Trigger-F (TRGI falling) 0x6 = Reset-F (TRGI falling) 0x7 = Gate-L (TRGI low)	0x00

### 1.32.5. TM26 Timer control register 0

<b>TM26_CR0</b>	<b>TM26 Timer control register 0</b>
Offset Address :	<b>0x10</b>
Reset Value :	<b>0x00000000</b>

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved					<b>TM26_IDC_EN</b>	<b>TM26_RC_STP</b>	<b>TM26_RC_EN</b>
15	14	13	12	11	10	9	8
<b>TM26_UEX_EN</b>	<b>TM26_USW_EN</b>	<b>TM26_DIR_INV</b>	<b>TM26_UEV_DIS</b>	<b>TM26_EX_INV</b>	<b>TM26_EX_EN</b>	<b>TM26_ACLEAR_EN</b>	<b>TM26_ASTOP_EN</b>
7	6	5	4	3	2	1	0
<b>TM26_DIR2</b>	<b>TM26_DIR</b>	<b>TM26_MDS[1:0]</b>		Reserved	Reserved	<b>TM26_EN2</b>	<b>TM26_EN</b>

Bit	Attr	Bit Name	Description	Reset
31..24	-	Reserved	Reserved	0x00
23..19	-	Reserved	Reserved	0x00
18	rw	<b>TM26_IDC_EN</b>	Input duty capture enable. When enables, the timer will start at leading edge and capture counter at trailing edge. Then timer is stopped at next leading edge. 0 = Disable 1 = Enable	0x00
17	rw	<b>TM26_RC_STP</b>	Main Counter stop enable when repetition counter underflow. 0 = Disable 1 = Enable	0x00
16	rw	<b>TM26_RC_EN</b>	Repetition Counter enable bit. 0 = Disable 1 = Enable	0x00
15	rw	<b>TM26_UEX_EN</b>	Timer external trigger update event enable.	0x00

			0 = Disable 1 = Enable	
14	rw	TM26_USW_EN	Timer software update event generation enable. (automatically clear by hardware) 0 = Disable 1 = Enable	0x00
13	rw	TM26_DIR_INV	Main Timer counting direction inverted enable. 0 = Normal 1 = Inverted	0x00
12	rw	TM26_UEV_DIS	Update event generation disable for main Timer. Update event is generation from counter overflow/underflow or software register forced bit. 0 = Enable 1 = Disable	0x00
11	rw	TM26_EX_INV	Timer external trigger input inverted enable. 0 = Normal 1 = Inverted	0x00
10	rw	TM26_EX_EN	Timer external trigger event enable. 0 = Disable 1 = Enable	0x00
9	rw	TM26_ACLEAR_EN	Timer overflow or underflow flag auto-clear enable. This bit is no effect if TMx_ASTOP_EN is disabled. When enables, the timer will auto clear the flag of TMx_TOF or TMx_TUF after timer counting is overflow or underflow. 0 = Disable 1 = Enable	0x00
8	rw	TM26_ASTOP_EN	Timer auto stop mode enable. When enables, the timer will auto stop after timer counting is overflow or underflow. 0 = Disable 1 = Enable	0x00
7	rw	TM26_DIR2	2nd Timer counting direction bit. 0 = Up (Up Counting) 1 = Down (Down Counting)	0x00
6	rw	TM26_DIR	Main Timer counting direction bit. 0 = Up (Up Counting) 1 = Down (Down Counting)	0x00
5..4	rw	TM26_MDS	Timer operation mode select. When selects 'Cascade', both TMx_EN and TMx_EN2 must set the same setting of Enable or Disable. (x : module index) 0x0 = Cascade : 16-bit counter with 16-bit prescaler Mode 0x1 = Separate : Separated two 16-bit counters Mode 0x2 = Full-Counter : 32-bit counter Mode 0x3 = Reserved	0x00
3	-	Reserved	Reserved	0x00
2	-	Reserved	Reserved	0x00
1	rw	TM26_EN2	2nd Timer/Counter enable bit. 0 = Disable 1 = Enable	0x00
0	rw	TM26_EN	Main Timer/Counter enable bit. 0 = Disable 1 = Enable	0x00

### 1.32.6. TM26 Timer control register 1

TM26_CR1		TM26 Timer control register 1

31..16	-	Reserved	Reserved	0x0000
15..0	rw	TM26_CC0B	TM26 Timer capture and compare register 0B for channel 0. When the channel is configured as input capture mode, this register is used to capture the counter value of input trigger signal : (1) 2nd capture data for single edge (2) falling edge capture data for dual edge. When the channel is configured as output compare/PWM mode, this register is used as the compared preload register for software setting and will copy the value to TM26_CC0A. When the channel is configured as output two 8-bit compare/PWM mode, this register is separated to low 8-bit compared preload register for compare-L path and high 8-bit compared preload register for compare-H path.	0x0000

Reserved	LCD_CPRF	LCD_UDCF	LCD_SOF	Reserved		LCD_PRDYF	LCD_DEF

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..10	-	Reserved	Reserved	0x00
9	rw	LCD_BLKOFF	LCD blinking off interrupt flag. This bit is set at the start of LCD frame which is the first frame to switch display off during blinking period. This bit is cleared by software writing 1. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
8	rw	LCD_BLKONF	LCD blinking on interrupt flag. This bit is set at the start of LCD frame which is the first frame to switch display on during blinking period. This bit is cleared by software writing 1. 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
7	-	Reserved	Reserved	0x00
6	rw	LCD_CPRF	LCD charge pump power ready interrupt flag. (set by hardware and clear by software writing 1) 0 = Not : charge pump power is not ready 1 = Ready : charge pump power is ready	0x00
5	rw	LCD_UDCF	LCD update display data completed interrupt flag. This bit is set by hardware when the current display data has updated to display memory and user can start to write next display frame data. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	LCD_SOF	LCD start of frame interrupt flag. This bit is set when the LCD display starts a new frame and the display data has updated. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3..2	-	Reserved	Reserved	0x00
1	r	LCD_PRDYF	LCD internal power source ready statue. When LCD_VS_SEL is selected Off/AVDD/EXT, this flag is always active. When LCD_VS_SEL is selected CP, this flag is active if CP voltage is ready and is inactive if CP voltage is not ready. (set and clear by hardware) 0 = Not : Not ready 1 = Ready : Power source is ready to output voltage	0x00
0	r	LCD_DEF	LCD display enabled status. (set and clear by hardware) It indicates the real LCD display status. It will be active at start of first frame and be inactive at the end of the last displayed frame. 0 = Inactive : LCD display disabled	0x00

1 = Active : LCD display enabled

## 1.34.2. LCD interrupt enable register

LCD_INT		LCD interrupt enable register

## 1.40. RTC Control Registers

<b>RTC Control</b>	<b>(RTC) Real Time Clock Control</b>
Base Address :	<b>0x5D040000</b>

### 1.40.1. RTC status register

RTC_STA	RTC status register		
Offset Address :	0x00	Reset Value :	0x00000100

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved				RTC_CK_STA[3:0]			
7	6	5	4	3	2	1	0
Reserved		RTC_RCRF	RTC_TOF	RTC_TSF	RTC_PCF	RTC_ALMF	Reserved

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..12	-	Reserved	Reserved	0x00
11..8	r	RTC_CK_STA	Input clock source select MUX switching status. If the readback value is not following list, it indicates the clock source select MUX is switching and clock is not yet stable. 0x0 = Switching : MUX is switching and clock is not yet stable 0x1 = CK_LS 0x2 = CK_UT 0x4 = CK_APB 0x8 = TM01_TRGO	0x01
7..6	-	Reserved	Reserved	0x00
5	rw	RTC_RCRF	RTC reload or capture flag. This flag is active when RTC_RLR register reload finished, RTC_CAP register software capture finished or RTC_ALM register value update allowed flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
4	rw	RTC_TOF	RTC timer overflow interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
3	rw	RTC_TSF	RTC time stamp interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
2	rw	RTC_PCF	RTC periodic interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
1	rw	RTC_ALMF	RTC alarm matched interrupt flag. (set by hardware and clear by software writing 1) 0 = Normal (No event occurred) 1 = Happened (Event happened)	0x00
0	-	Reserved	Reserved	0x00

### 1.40.2. RTC interrupt enable register

RTC_INT		RTC interrupt enable register	
Offset Address :	0x04	Reset Value :	0x00000000

31	30	29	28	27	26	25	24
----	----	----	----	----	----	----	----

Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		RTC_RCR_IE	RTC_TIE	RTC_TS_IE	RTC_PC_IE	RTC_ALM_IE	RTC_IEA

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..8	-	Reserved	Reserved	0x00
7..6	-	Reserved	Reserved	0x00
5	rw	RTC_RCR_IE	RTC_RCR register reload finished, software capture finished or RTC_ALM register value update allowed interrupt enable. 0 = Disable 1 = Enable	0x00
4	rw	RTC_TIE	RTC timer overflow interrupt enable. 0 = Disable 1 = Enable	0x00
3	rw	RTC_TS_IE	RTC time stamp interrupt enable. 0 = Disable 1 = Enable	0x00
2	rw	RTC_PC_IE	RTC periodic interrupt enable. 0 = Disable 1 = Enable	0x00
1	rw	RTC_ALM_IE	RTC alarm matched interrupt enable. 0 = Disable 1 = Enable	0x00
0	rw	RTC_IEA	RTC interrupt all enable. When disables, the RTC global all interrupt event are disabled. When enables, the related event interrupt enable bit is to enable or disable the interrupt. 0 = Disable 1 = Enable	0x00

### 1.40.3. RTC clock source register

<b>RTC_CLK</b>	<b>RTC clock source register</b>
Offset Address :	0x08
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RTC_CK_PDIV	Reserved	RTC_CK_DIV[1:0]		RTC_CK_SEL[1:0]		Reserved	

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..8	-	Reserved	Reserved	0x00
7	rw	RTC_CK_PDIV	RTC internal clock CK_RTC_INT input pre-divider 0x0 = DIV4096 : divided by 4096 0x1 = DIV1 : divided by 1	0x00
6	-	Reserved	Reserved	0x00
5..4	rw	RTC_CK_DIV	RTC internal clock CK_RTC_INT input divider 0x0 = DIV1 : divided by 1 0x1 = DIV2 : divided by 2 0x2 = DIV4 : divided by 4 0x3 = DIV8 : divided by 8	0x00

3..2	rw	<b>RTC_CK_SEL</b>	RTC input clock CK_RTC source select. 0x0 = CK_LS 0x1 = CK_UT 0x2 = CK_APB 0x3 = TM01_TRGO	0x00
1..0	-	<b>Reserved</b>	Reserved	0x00

#### 1.40.4. RTC write protected Key register

<b>RTC_KEY</b>	<b>RTC write protected Key register</b>
Offset Address :	<b>0x0C</b>
Reset Value :	<b>0x00000001</b>

31	30	29	28	27	26	25	24
<b>RTC_LOCK[15:8]</b>							
23	22	21	20	19	18	17	16
<b>RTC_LOCK[7:0]</b>							
15	14	13	12	11	10	9	8
<b>RTC_KEY[15:8]</b>							
7	6	5	4	3	2	1	0
<b>RTC_KEY[7:0]</b>							

Bit	Attr	Bit Name	Description	Reset
31..16	rw	<b>RTC_LOCK</b>	RTC lock register. Write value 0x712A to lock the register write access except RTC_STA, RTC_KEY registers. When locks, the registers cannot change until Cold reset. Write other value except 0x712A is no effect. For read access : 0 = Unlocked 1 = Locked	0x0000
15..0	rw	<b>RTC_KEY</b>	RTC key register. Write value 0xA217 to unprotect the register write access. Write other value except 0xA217 to protect the register except RTC_STA, RTC_KEY registers. For read access : 0 = Unprotected 1 = Protected	0x0001

#### 1.40.5. RTC control register 0

<b>RTC_CR0</b>	<b>RTC control register 0</b>
Offset Address :	<b>0x10</b>
Reset Value :	<b>0x00000000</b>

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved				RTC_TF_WPEN	Reserved	RTC_PC_WPEN	RTC_ALM_WPEN
15	14	13	12	11	10	9	8
RTC_OUT_LCK	RTC_OUT_STA	RTC_TS_TRGS[1:0]		Reserved	Reserved	RTC_OUT_SEL[1:0]	
7	6	5	4	3	2	1	0
Reserved		RTC_RCR_MDS[1:0]		Reserved		RTC_ALM_EN	RTC_EN

Bit	Attr	Bit Name	Description	Reset
31..24	-	<b>Reserved</b>	Reserved	0x00
23..20	-	<b>Reserved</b>	Reserved	0x00
19	rw	<b>RTC_TF_WPEN</b>	RTC detect RTC_TOF flag wakeup from STOP mode enable bit. 0 = Disable 1 = Enable	0x00
18	-	<b>Reserved</b>	Reserved	0x00
17	rw	<b>RTC_PC_WPEN</b>	RTC detect RTC_PCF flag wakeup from STOP mode enable bit. 0 = Disable	0x00

			1 = Enable	
16	rw	<b>RTC_ALM_WPEN</b>	RTC detect RTC_ALMF flag wakeup from STOP mode enable bit. 0 = Disable 1 = Enable	0x00
15	rw	<b>RTC_OUT_LCK</b>	RTC_OUT output signal initial state control. When locked, disables the RTC_OUT_STA register bit write access. Hardware auto clear after register write access. 0 = Locked 1 = Un-Locked	0x00
14	w	<b>RTC_OUT_STA</b>	RTC_OUT output signal initial state. The bit is written effectively only by written 1 to RTC_OUT_LCK simultaneously. 0 = 0 (Output 0) 1 = 1 (Output 1)	0x00
13..12	rw	<b>RTC_TS_TRGS</b>	RTC time stamp trigger edge select. 0x0 = Disable 0x1 = Rising edge 0x2 = Falling edge 0x3 = Dual-edge	0x00
11	-	<b>Reserved</b>	Reserved	0x00
10	-	<b>Reserved</b>	Reserved	0x00
9..8	rw	<b>RTC_OUT_SEL</b>	RTC output signal select. When selects 'PC', the RTC_CK_DIV and RTC_CK_PDIV cannot set both divided by 1. 0x0 = ALM : Alarm compare output event 0x1 = PC : CK_RTC_INT periodic clock signal 0x2 = TS : Time stamp trigger event 0x3 = TO : Timer overflow signal toggle output	0x00
7..6	-	<b>Reserved</b>	Reserved	0x00
5..4	rw	<b>RTC_RCR_MDS</b>	RTC timer reload or capture control mode select. If selects 'Directly capture' or 'Delayed capture' mode, the RTC timer counter value will capture into the RTC_CAP register when software capture event (RTC_RC_START=1) or hardware time stamp event happened. If selects 'Force reload', the RTC timer counter will be updated by RTC_RLR register value when RTC_RLR has been written. If selects 'Auto reload' mode, the RTC timer counter will be update by RTC_RLR register value when RTC timer is overflow. 0x0 = Directly capture 0x1 = Delayed capture 0x2 = Forced reload 0x3 = Auto reload	0x00
3..2	-	<b>Reserved</b>	Reserved	0x00
1	rw	<b>RTC_ALM_EN</b>	RTC Alarm enable bit. When disables, hardware will assert the RTC_RCRF flag to notify software. Then software can update the RTC_ALM register value. 0 = Disable 1 = Enable	0x00
0	rw	<b>RTC_EN</b>	RTC function enable bit. 0 = Disable 1 = Enable	0x00

#### 1.40.6. RTC control register 1

<b>RTC_CR1</b>		<b>RTC control register 1</b>					
Offset Address :		<b>0x14</b>		Reset Value :		<b>0x00000000</b>	
31	30	29	28	27	26	25	24
<b>Reserved</b>							
23	22	21	20	19	18	17	16
<b>Reserved</b>							

15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							RTC_RC_START

Bit	Attr	Bit Name	Description	Reset
31..16	-	Reserved	Reserved	0x0000
15..8	-	Reserved	Reserved	0x00
7..1	-	Reserved	Reserved	0x00
0	rw	RTC_RC_START	RTC timer counter reload and software capture start enable. For forced and auto reload mode when this bit enables, the RTC_RLR register value will reload to RTC timer. For capture mode when this bit enables, the RTC start to capture the counter value. When capture is finished, the timer value is captured to RTC_CAP. After reload or capture finished, RTC automatically clear this bit and set the RTC_RCRF flag. 0 = No effect 1 = Enable	0x00

### 1.40.7. RTC reload register

<b>RTC_RLR</b>	<b>RTC reload register</b>
Offset Address :	0x18
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
RTC_RLR[31:24]							
23	22	21	20	19	18	17	16
RTC_RLR[23:16]							
15	14	13	12	11	10	9	8
RTC_RLR[15:8]							
7	6	5	4	3	2	1	0
RTC_RLR[7:0]							

Bit	Attr	Bit Name	Description	Reset
31..0	rw	RTC_RLR	RTC counter reload register. The value 0xFFFFFFFF is invalid.	0x00000000

### 1.40.8. RTC alarm compare register

<b>RTC_ALM</b>	<b>RTC alarm compare register</b>
Offset Address :	0x1C
Reset Value :	0x00000000

31	30	29	28	27	26	25	24
RTC_ALM[31:24]							
23	22	21	20	19	18	17	16
RTC_ALM[23:16]							
15	14	13	12	11	10	9	8
RTC_ALM[15:8]							
7	6	5	4	3	2	1	0
RTC_ALM[7:0]							

Bit	Attr	Bit Name	Description	Reset
31..0	rw	RTC_ALM	RTC alarm compared value register. This register is able to update under RTC_ALM_EN=0. When RTC_ALM_EN=1, update this register may be quite possible to asserted abnormal RTC flag. Refer the detail information in RTC_ALM_EN register description.	0x00000000

### 1.40.9. RTC capture register

RTC_CAP		RTC capture register					
Offset Address :		0x20		Reset Value :		0x00000000	
31	30	29	28	27	26	25	24
RTC_CAP[31:24]							
23	22	21	20	19	18	17	16
RTC_CAP[23:16]							
15	14	13	12	11	10	9	8
RTC_CAP[15:8]							
7	6	5	4	3	2	1	0
RTC_CAP[7:0]							

  

Bit	Attr	Bit Name	Description	Reset
31..0	r	RTC_CAP	RTC counter capture register. See more detail information in RTC_RCR_MDS register descriptions.	0x00000000

## 1.40.10. RTC Register Map

## 2. Revision History

Version 1.04 Register Definitions (2025_1014)	
1	Update register description for URTx_RTS_INV.
2	Change default value from 0 to 1 in SPI0_IDL_STA and from 1 to 0 in SPI0_NSS_SWI.
Version 1.02 Register Definitions (2025_0704)	
1	Update register descriptions of APX_ASB[3:0]_TCIE and APX_ASB[3:0]_TIE.
Version 1.01 Register Definitions (2025_0401)	
1	Update register descriptions of MEM_ISP_REN, MEM_ISP_WEN and MEM_ISPD_REN about Code reset.
2	Change LCD_VT_SEL value definition 0xF to reserved.
3	Change default value from 1 to 0 for PC_SC2, PC_SC3, SYS_IEA bits.
4	Update register description for RST_EX_CE, CFG_PLL_TST, CFG_FTSTO.
Version 0.95 Register Definitions (2024_1025)	
1	Initial version for register definitions

### 3. List of abbreviations for registers

Abbreviations	Definition	Descriptions
<b>Attr</b>	access Attribute	Register read/write access attribute
<b>rw</b>	Read/Writer	Indicate the register can be read or write by software.
<b>r</b>	Read	Indicate the register can be read only by software.
<b>w</b>	Write	Indicate the register can be written only by software.
<b>Reserved</b>	Reserved register	Indicate the register is reserved for internal using or future design.
<b>Reset</b>	Reset value	The register default value after chip warm/cold reset by design default or loaded from OB(option byte flash)
<b>Base Address</b>	absolute address	The Base Address is using as the absolute address of CPU addressing for all the registers of a module. The actual address of a register is the Base Address plus the Offset Address.
<b>Offset Address</b>	related address	The Offset Address is using as the related address for one of the registers of a module. The actual address of a register is the Base Address plus the Offset Address.
